

Satellite image indication of suitability

Soils that are too rocky are not suitable for viticulture.

The 2009 Google Earth imagery clearly shows areas of better growth (green), compared to areas of poor growth (brown). Site observations indicated that the brown areas correspond to shallow rock.

The Tempus site is almost all brown. The adjacent vineyard is clearly sited to suit the areas with more soil depth.

White - approx. vineyard blocks.

Orange - approx. Tempus block.
