ARCHIVAL RECORD

CONTENTS

INTRODUCTION

BACKGROUND

This Archival Record of Bridgewater Crossing in Bridgewater, Tasmania has been prepared for the Department of State Growth. The recording is intended to capture the context and setting of the Bridgewater Crossing, inclusive of the bridge, causeway and associated features, prior to the construction of the new Bridgewater Bridge. The causeway, bridge, and associated features that form the Bridgewater Crossing are currently included on the Tasmania Heritage Register (THR) and due to their heritage significance, this Archival Record has been prepared prior to the proposed works. This report aims to document Bridgewater Crossing in accordance with the guidelines for Archival Recordings specified by the NSW Heritage Office, having been identified as a best practice guide.

Hanna Morgan, Heritage Specialist of Purcell prepared this report with overview by Lucy Burke-Smith, Associate and Tracey Skovronek, Regional Partner. The photographs that form this Archival Record were taken by Martin Passingham on Monday 22nd March, 2021. The historic drawings included at Appendix 5 were sourced from the Department of State Growth and Point Cloud model was prepared by JACOBS. Sample views of the Point Cloud Model and included in this report only; a copy of the model is held with the Department of State Growth and can be viewed with 3D Viewer freeware.

METHODOLOGY

This report has been prepared in accordance with the guidelines for Archival Recordings specified by the NSW Heritage Office, including methodology and report format.

Each photograph has been allocated a unique name/number, refer Appendix 3. The name/numbers are then cross referenced to the Plan and Catalogue Sheets, refer Appendices 1 and 2. Markers are used on the Plan Sheet to indicate the location in which the photographs were taken. The Catalogue Sheets record the project details, date, photographer's name, camera type and lenses used, photographic data, direction and brief description of each photograph.

This Archival Record captures close-up and overall views of the Bridgewater Crossing, limited to the bridge and causeway only, as well as the immediate context. The photographic documentation follows a clockwise order starting at Location 1 and finishing at Location 8 depicted on the aerial site map (refer plan at Appendix 1). Limitations include suitable vantage points to capture all angles of the bridge structure, causeway, and associated infrastructure features.

UNDERSTANDING THE SITE

LOCATION

Bridgewater Crossing comprises the causeway and bridge which crosses the Derwent River, in Bridgewater Tasmania, located within the Brighton Municipal Council Local Government Area (LGA). The broader cultural landscape of the Bridgewater crossing has been considered in some detail by GHD and is summarised as follows[1]:

> The place connects Granton on the southern shore of the Derwent with Bridgewater on the north. It consists of the causeway, historic bridge infrastructure and the extant road and rail bridge. The crossing at this point of the Derwent is some 1.08 kilometres. The lower foothills of Snake Mount form the background on the southern shore, characterised by native vegetation on the upper slopes and low density residential development on the lower slopes. The immediate foreground of the causeway is the convict quarry from which the material used in its construction was obtained. Remnant historic buildings of these works include the Watch House and the Commandant's Cottage. The causeway itself is a low linear feature, approximately 785 metres long, as measured from the Brooker, Midland and Lyell Highway roundabout. Vegetated embankments rise on either side rise slightly above the roadway. The causeway has some visual prominence when viewed obliquely from surrounding road networks.
>
> The Bridgewater Bridge is a prominent element in the landscape, notable for its truss form and in particular the two towers and lifting mechanism. Although visible from the Brooker Highway, its dark colouring does not make the bridge a distinctive element on its southern approach until in close proximity to the causeway. Conversely, the bridge stands out distinctly against the sky when viewed from the Lyell Highway, Boyer Road and Woods Point at Bridgewater.

Location map showing extent of the Bridgewater Crossing (causeway and bridge) shaded in yellow (Source: Google Maps modified by Purcell, boundary information supplied by Austral Tasmania). Note: north to top of page.

HISTORICAL SUMMARY

The following Historical Summary draws from the Draft Bridgewater Causeway and Bridge Historic Heritage Assessment and Archaeological Zoning Plan, prepared by Austral (Tas) 27 August 2020:

Introduction

The study area forms part of a rich historic cultural heritage landscape which demonstrates the evolution of transport over a period of more than two hundred years. The European history of the place has witnessed these changes from ferries, a causeway, numerous road and rail bridges, and the current structure built in the 1940s. Each phase has left evidence in the landscape, which is discussed in the following sections. It is drawn principally from previous detailed assessments of the place. Original references are provided.[2]

Arranged chronologically, this historical overview addresses the following key phases of use and development:

- The Aboriginal People of the Area and Contact History;
- Early European settlement of Hobart;
- The Black Snake Inn and Early Development of the Area;
- The Bridgewater Causeway and Convict Road Station;
- Earlier Bridge Crossings of the Derwent at Bridgewater:
  - The 1849 Timber Bridge;
  - The 1874 Tasmanian Main Line Railway Bridge;
  - The 1893 Road and Rail Bridge;
  - 1908 Conversion of the 1874 Rail Bridge to Road Uses;
- The Current Bridgewater Bridge;
  - The Designer of the Bridge AW Knight;
  - Welding Technologies used in the Bridge; and
- Later Modifications to the Bridgewater Bridge.

The Aboriginal People of the Area and Contact History

Before European settlement, Ryan has described Tasmanian Aboriginal society as consisting of nine nations, each containing multiple social units or bands. Boundaries between groups could vary between well-defined borders based on geographical features, to broader transitional zones existing between two friendly tribes.

The Derwent formed the boundary between two such nations. The western shore of the Derwent was part of the lands of the South East nation. Their territory covered an area of approximately 3,100 square kilometres to encompass the western shore of the Derwent north to New Norfolk, the D'Entrecasteaux Channel and Bruny Island, and south to South Cape, extending west to the Huon Valley. Ryan writes that prior to European contact, the area probably contained seven bands, each with about 70 to 80 people. The Hobart area was home to the Muwinina band. They knew the area as Nibberloone or Linghe.

The eastern shore is part of the country of the Oyster Bay people. Located on the east coast of Tasmania, their lands covered some 7,800 square kilometres, including 515 kilometres of coastline. Their country extended from St Patricks Head in the north, to the east bank of the Derwent. Inland, it reached St Peters Pass in the Midlands, before following the Eastern Tiers to the Break O'Day River, where it returned to the coast at St Patricks Head.

Prior to European settlement, Ryan proposes that ten bands formed part of the Oyster Bay nation with a population of between 700-800 people, the largest group in Tasmania. The Risdon and Pitt Water areas were the home of the Moomairremener band.[3]

Contact between Europeans and Aboriginal people occurred on both sides of the Derwent. With the establishment of Hobart Town in 1804 the Reverend Robert Knopwood made brief notes in his diary on contact between the two groups. An entry in March 1804 records his observations on encountering 'a great many native hutts [sic] and the fires they made' on the western shore of the Derwent, north of Hobart. Two days later he noted many Aboriginal people were around the camp at Sullivans Cove, but could not be persuaded to enter. On numerous occasions, Knopwood wrote of the fires lit by the Aboriginal people for both land management and hunting.[4]

Initial contact between the Muwinina and Europeans was positive. Although not visiting the settlement, the Aboriginal people were friendly with small groups of Europeans they met at more isolated areas. Such relations were not to last, as by 1806, violence had already began to emerge. Conflict over food resources was one of the triggers in the deteriorating relationship. By necessity, the European settlers sought to augment their meagre stores with fresh caught game, mainly kangaroos, thereby placing them in direct competition with the Aboriginal people. So insatiable was the European demand for kangaroos, that by late 1808 this food resource had largely been exhausted from the immediate surrounds of Hobart, with hunting parties having to venture further afield.[5]

[5] Ryan, op. cit., pp.76-78

On the eastern shore of the Derwent, contact between Europeans and Aboriginal people began during the late-eighteenth century. In 1798 Bass and Flinders explored the Derwent venturing as far as what is now Bridgewater, and reaching an inlet of the river, which they named Herdsman's Cove. From here, Flinders travelled two miles inland up the Jordan River. It was in the vicinity of Herdsman's Cove that an encounter took place with Aboriginal people. Finding two women and a man carrying three spears, Bass and Flinders attempted to communicate with the group by offering them a black swan. The two women left, but the man remained.[6]

Following a failed attempt to follow him to his hut, Bass and Flinders left the man - their only encounter with Aboriginal people in Van Diemen's Land.[7] A few years later in 1802, Peron found some huts, smouldering fires and remains of food in the vicinity of Herdsman's Cove, but no Aboriginal people were seen.[8]

In September the following year, Lieutenant John Bowen arrived at Risdon Cove, establishing the first permanent European settlement in Van Diemen's Land. Uneasy contact between the Aboriginal people and settlers descended into conflict in May 1804.[9]

The period 1804 to 1824 has been described as one of 'uneasy coexistence' between Aboriginal people and Europeans. Certainly, there were outbreaks of hostilities, but by comparison with what occurred post-1824, the first two decades since the coming of the Europeans were relatively calm.[10]

Such relative peace was not to last. During the 1820s, the European population grew rapidly, accompanied by an explosion in the issuing of land grants over the most valuable grass plains. These actions created disputes over access to native game, hunting grounds and the connection of Aboriginal people with their traditional tribal lands. What followed was unprecedented violence.[11]

Early European settlement of Hobart

The first decade of European settlement in Hobart was marked by the close relationship between development and the waterfront. After the failure of the settlement at Risdon Cove and the relocation to Sullivans Cove on the western shore in February 1804, the early occupants of Hobart Town spent their first decade in a struggle for survival, building upon the camp clustered on the western boundary of the cove.[12]

In 1806 Lieutenant Governor Collins wrote of his reliance on the small amounts of wheat and barley which were grown at the government farm at New Town. This was supplemented by locally procured game. The lack of food was not the only problem faced by the young settlement, with the physical condition and morale of the general population being a cause of concern. Collins described them as having been scantily clad and badly fed for a year, and by mid-1806 they were largely destitute of clothing. To supply goods and food he requested that ships be sent to Hobart first instead of Sydney.[13]

Merchant ships were not permitted to enter the Derwent until 1813. After this time and most notably when the embargo on whaling was lifted, port activity gradually increased. Despite these impediments it was not long before settlement spread out along the shores of the Derwent, albeit on a limited scale. By the late 1820s the numbers and size of ships using the port had increased markedly, coinciding also with the beginning of urbanisation. At this time the population of the town had reached 6,000. The rapid increase in demand for port facilities was not solely due to the importation of goods as had previously been the case, but also the beginning of trade in export commodities.[14]

The Black Snake Inn and Early Development of the Area

Travellers were some of the first Europeans to visit the Granton area, or Black Snake as it was originally known. In 1811, Governor Macquarie during his first visit to Van Diemen's Land wrote in his diary about a trip to New Norfolk, where he and his party had breakfast at Black Snake Point. Knopwood's diary also mentions frequent visits to the Black Snake Inn between 1819 and 1825.[15]

The first Black Snake Inn was probably constructed between 1817 and 1821 by which time a ferry crossing the Derwent was in operation from the location. This also corresponds with the period when travel became more frequent with the completion of the road constructed by McCarty between Hobart and New Norfolk in 1819, Tasmania's first formed road. A population centre had emerged at Black Snake. In 1824, 23 children were attending school in the area.[16]

During the late 1820s or early 1830s the current gothic inspired building was constructed, presumably on the same site as the first inn.[17] The Black Snake Inn was one crossing place of the Derwent used by ferries. A number of flat bottomed punts and clinker type craft crossed the river back and forth from select locations. There were two well known crossing points on this part of the Derwent; one from Roseneath

(Austin's Ferry) to Herdsman's Cove and Old Beach, and the second from Black Snake to Herdsman's Cove and Green Point. Travel by ferry could be dangerous and was often inconvenient, being dependant on the current, wind and availability of the service.[18]

By this time, the inn had diversified and offered both ferry and coach transport to travellers. Throughout its life the inn has functioned as a public house, shop and currently is a private residence.[19]

The Bridgewater Causeway and Convict Road Station

In 1826 the Land Commissioners investigated the best location for crossing the Derwent. After some deliberation a site at Black Snake was decided on. There was plentiful timber at nearby Mount Dromedary, while stone was available from quarrying away at the hill behind the intended causeway, at what is now Granton. The river at this point also included a sand and mud bar which ran most of the way over the Derwent, and at a shallow depth.[20] This was seen as a desirable attribute in constructing a causeway, but one that was later to cause considerable issues. In 1830 the convict station at Bridgewater (which later became known as Granton) was opened and works began on constructing the causeway.[21] Works were to prove a very slow affair. To hasten progress, John Lee Archer, civil engineer recommended the construction of a timber railway with trucks to be pulled by bullocks.[22]

Ross's almanac for 1831 wrote:

> An establishment has been formed at Bridgewater for a Chain Gang, which is employed in constructing that great work, the causeway over the Derwent. A gaol or barracks for the reception and safe keeping of the prisoners after their hours of labor, was among the first works completed; It is capable, of containing 160 men. A commodious barracks for the military has also been constructed, as well as a store, solitary cells for such convicts as misconduct themselves, &c, &c. On a commanding eminence stands a neat building for the Officers quarters.
>
> A very excellent quarry on the road side gives employment to one part of the gang, while the others are busily engaged in wheeling the stone out into the water. The bed of the river over the flats at this place is composed of soft mud, which the heavy mass of stone thus thrown upon it soon displaces, and in this manner a good foundation is obtained on which to raise the subsequent work. Five and twenty small abutments will then be built and covered with timber. From the piers to the edge of the deep channel a solid road of stone will be formed with a small basin at the end to haul the punt into. As the distance across is very trifling no delay can occur, because the punt instead of being towed by a boat will be made to swing backwards and forwards.[23]

This was perhaps the last positive account of the works, which were not trifling by any measure. The causeway was constructed at an oblique angle, which was not the shortest point of crossing, although planned that way to contend with the wind and currents at this stretch of the Derwent. Early attempts at constructing piers in the sand and mud were found to be a failure due the failure to find a solid bottom.[24] The work was beset by controversy and labelled a 'folly' when the tons of stone dumped into the river were continually submerged in the mud and silt, without a trace. This perhaps simplifies the construction of the causeway to little more than dumping rock in the river. There was however engineering to the structure, as referred to by Ross and the construction of 25 abutments. Other contemporary accounts provide a few more clues.

A curious description of the causeway was given, midway during construction. It noted a structure quite different to the one we know:

> The work at this station [Bridgewater], was the construction of a massive bridge across the Derwent, which is here three-fourths of a mile in breadth. It had been a long time since it was commenced, and was not yet completed when I finally left the island. It is composed almost entirely of stone. From either shore two solid stone abutments extends to some distance into the river. Other abutments are placed at regular distances, also filled with stone. Arches of stone span the spaces, at a sufficient height to permit the passage of small steam boats. Before its final completion the bridge somewhat resembles a shallow aqueduct, but instead of water is filled with pounded stone, thus making a way over the water in all respects like the road itself.[25]

Other than its description as being composed of stone and the presence of abutments, it is difficult to reconcile this description with what was actually constructed. Abutments only extended from the southern shore of the Derwent, and while arches were constructed, it seems unlikely that they could accommodate small steam boats. As a description made part way through construction works, the writer's interpretation may have been inaccurate.[26]

By 1833 the causeway extended for some 365 metres. It was 28 metres wide at its base and 16 metres wide at the top. Roderic O'Connor made an urgent request for 250 planks required to complete the 'bridge', used in some form in the construction of the causeway.[27] By the following year the causeway had reached a length of some 708 metres, reaching nearly its ultimate length. The causeway committee investigated the works in July 1834, finding that the portion immediately beyond the arches (towards its southern end) had already been sinking into the mud for some time. The obvious solution was to support the structure with piles, but the costs of such works were unacceptable. Instead, they favoured the use of vegetation rafts on which the stone would be supported, and disappointed that such a method had not been adopted from the start. They also recommended the removal of the arches at the southern end, where the current

risked undermining the causeway.[28] A plan was prepared, recommending the proposed point of connection with the northern shore of the Derwent

It was to take a further two years however before it was finished, likely because of the continual subsidence into the mud. Works to date included the construction of six piers, upon which planks were laid, allowing carts to travel across the short distance. When finally the causeway formation did appear above the water line, it was prone to subsidence and had to be continually built up. The continued dumping of rock displaced large volumes of mud, creating banks on either side of the causeway. There was no shortage of opinion on how to deal with the problem and perhaps the original concept was modified over time. Nevertheless, the majority sources, including artwork, depict the causeway as an unbroken formation of stone.[29]

Structural problems continued into 1835. A report was prepared which supported the use of vegetation rafts as the best solution, but questioning the integrity of the embankments on either side of the causeway. It recommended that the walling on either side be at least 1.2 metres thick and battered. Those already constructed were found to be badly placed and did not have a sufficient hold on the bank.[30]

As it neared completion in 1835, more positive accounts began to be published on the 'magnificent work' that would address the dangers and difficulties of crossing the Derwent, which was cut to only a 3 minute punt ride connecting from the end of the causeway to the northern shore.[31] One very detailed report noted how the overseers had addressed the fruitless problem of stone being swallowed up by the mud. The *Hobart Town Courier* wrote:

> This stupendous undertaking is situated about 11 miles from Hobart town, It consists of a mound or roadway carried out over an extensive bank, near a mile in extent to the edge of deep water and the stream, so as to reach within a short distance of the opposite bank, the earth and stone for the purpose being dug from a hill contiguous with the river. Much of the stone and materials originally carried out of course subsided in the mud, until it became sufficiently solid, and in one part the mud thus pushed out has risen on each side and formed small islands, now rapidly covering with verdure.
>
> By adopting the expedient of laying a compact bottom of logs and dead timber on the mud so as better to prevent the earth and stone from subsiding, the work is proceeding with great rapidity and about three-quarters of a mile of the mound are now finished on a firm basis, so as to admit of carriages of any weight or description freely to pass.
>
> ….
>
> It is a curious fact and one which serves to declare the stability of the work that in times of heavy rains, when the flow of fresh water is strong down the river, that the level is invariably some inches higher on the lower side of the embankment, than on the upper, caused doubtless from the meeting of the tide with the freshwater. For these reasons, Lieut. Wrixon, with the advice of the Inspector has very judiciously shut up the arches that were originally left open at the south extremity as a sort of safety valve in case of any accumulated force of the stream pressing with injury on either side. The stones which composed these arches being removed, have been applied to the purpose of erecting a large and lofty room or hall, used as a church and school room.[32]

The ingenuity of constructing rafts of timber and vegetation to support the weight of the stones appears to have been the solution to the never ending problem of the mud. The article also describes arches on the southern end of the causeway, which is again consistent with the earlier description given above, but that these arches had been removed by 1835 and the stone used elsewhere. However, whether these arches were high enough to allow small steam boats to pass beneath seems somewhat dubious. The success of the raft system was however already in doubt, an acerbic article from as early as 1836 describing the causeway as 'floating on a foundation of brushwood faggots, which will continue at intervals to sink in various places with its super incumbent weighty until it has displaced the soft mud.'[33] This subsidence was already occurring as early as 1836. Wrixon had commanded the laying of the road metal along the course of the causeway, only to be ordered to raise the causeway in height by another 1.2 metres.[34]

The grand opening of the causeway was made in October 1836 by Lieutenant-Governor Arthur with a guard of honour and the band and colours of the Scotch Fusiliers. It was approximately 730 metres long, 20 metres wide and contained 400,000 cubic metres of fill. At the time, its cost of £45,000 was enormous. From its northern end was a gap approximately 340 metres across the Derwent to the northern shore. Between 1836 and 1849 a 'flying bridge' or ferry winched on cables connected the causeway with the shore.[35]

In 1863 the causeway was widened and raised by some 76 centimetres in attempt to avoid overtopping by the water. Low stone walls were constructed on both sides of the causeway to bind the new fill. It was again widened on the downstream side in 1874 to accommodate the Tasmanian Main Line Railway, and later in 1893 when the bridge was converted to combine both road and rail uses.[36]

The 1849 Timber Bridge

Parliament authorised the construction of the first bridge to span the gap of 340 metres in 1846. The contract for its construction was awarded to Messrs. Thomas and Blackburn in early 1847. Convicts from the Mount Dromedary probation station spent the remainder of the year cutting and stockpiling timber for the bridge. The *Illustrated London News* wrote in 1851 how roads first had to be cut into the gullies

on the steep mountain sides to facilitate removal of the timber. Two of these gullies were lined with timber, forming a chute down which the logs were moved. The process was intensive. First the timber was loaded into a chute and propelled downward by its own momentum to a benched landing where it was manoeuvred to another chute which conveyed it to the base of the mountain. There, the terrain was of sufficient grade to allow the logs to be carried by wagons to the water's edge. From here, it was towed by boats to the work site.[37]

Construction of the timber bridge works began in January 1848, starting at the northern end of the causeway. The bridge was not built as a straight extension of the causeway, rather its alignment diverged ten degrees eastwards to the nearest point of the river bank, and the same location used for the ferry wharf. The wharf was demolished and a temporary wharf constructed nearby.[38]

The spans of the bridge were supported by over 360 timber piles. To allow for river navigation upstream to New Norfolk, the bridge (and all subsequent structures) included moving spans. Originally a swing span was proposed for Bridgewater, but this was substituted with a rolling span modelled on a prototype bridge over the Arun River, England.[39]

The bridge was opened to traffic on 26 April 1849 with a roadway 7.3 metres wide. A series of landing or fender piles were installed in the river both up and down stream for some 55 metres to assist shipping in negotiating the opening. Tolls were collected until 1880, and a toll keepers house was located near the bridge approach. A new house for the toll keepers was built c.1870 to replace the old one, but was located so close to the river that water entered its basement at high tide. The causeway was also raised around c.1860 to avoid 'overtopping' by water. Following the abolition of tolls the toll keeper became known as the bridge keeper and the old toll house survived until about 1947.[40]

The 1874 Tasmanian Main Line Railway Bridge

Works to construct a rail line between Hobart and Launceston began in 1872, with the Derwent being a key challenge to the project. In response, in 1874 the Tasmanian Main Line Railway Company constructed a separate timber rail bridge on the downstream side of the causeway. The bridge keyed into the causeway on a curve, approximately 30 metres before its end, before running parallel to the 1849 road bridge for 350 metres to the northern bank of the river. The 1874 bridge also required a moving span and a lattice girder iron bridge was installed which pivoted on a turntable. The railway was intended primarily for the transport of goods between Hobart and Launceston, but from 1875 passenger carriages were attached on weekdays with coach transfers.[41]

The moving bridge span was supported by timber piles, and this construction method caused problems with subsidence. As a precaution, measures were put in place to ensure that the span was locked in place before every train crossing. However, the Rail Engineer in Chief was never truly satisfied with these measures, nor the signalling equipment at the Bridgewater end. These fears came to be when disaster struck in 1886. The swing span had shifted slightly resulting in the Launceston express engine being derailed and overturned. One rail worker and one passenger died in the accident.[42]

Infrastructure changes in Bridgewater to accommodate the railway included the construction of a small stockyard and passenger station in the vicinity of the existing War Memorial Reserve, and gated crossings on all secondary roads. The junction between the railway and the Main Road was monitored from a small two storeyed signal box just north of the station.[43]

The 1893 Road and Rail Bridge

By 1888, the 1849 road bridge was declared unsafe. However, without other options, it continued to be used. In 1891 a contract was awarded for the construction of a new road bridge. Like all previous, it included a swing span, which was fabricated in England and completed in 1893. The new bridge was upstream, or to the west of the 1849 bridge. Its completion resulted in the strange scenario of three bridges extending from the northern end of the causeway.[44]

The design of the 1893 bridge allowed for its later conversion to a rail bridge. It was largely constructed from timber with the exception of the pier or caisson on which the plate girder swing span turned. This bridge extended straight out from the causeway and landed on the northern bank. The northern abutment adopted a dog-leg design to enable it to accommodate the heavy railway traffic straight ahead and a lighter roadway that would curve eastward. The bridge was over 360 metres long with a road width of 6.5 metres that narrowed to five metres over the swing span. The navigable channel was 13 metres wide. The 1849 road bridge was retained in anticipation that it would be required as a temporary detour while the new bridge was converted to rail use. However, this was not to happen until 1906-07 by which time the former had become a danger to the 1874 rail bridge. The 1849 was eventually demolished in 1899.[45]

The old 1874 Tasmanian Main Line Railway Bridge coupled with the advent of heavier locomotives, made the transfer to the 1893 bridge urgent. In 1906-07 the conversion works began. These works required the widening of the full length of the causeway on the upstream, western side, substantial filling in behind the northern abutment and land acquisition at Bridgewater. The rail line was transferred from the eastern to the western side of the causeway, where it remains to this day. In response, a new station was constructed adjacent to the bridge abutments on the Bridgewater side. Shared use by road and rail of the 1893 bridge began in January 1908. However, community disquiet about the length of delays in road traffic and compromised safety conditions, led to a reversal of positions and the conversion of the 1874 rail bridge to a road bridge.[46]

1908 Conversion of the 1874 Rail Bridge to Road Uses

In 1908 the 1874 railway bridge was converted to road uses. This required the bridge to be re-piled and the deck converted to accommodate a two lane roadway. It was opened in 1908. The new approaches to the bridge resulted in demolition of the 1876 and 1887 railway station platforms at Bridgewater.[47]

Joint use of both rail and road of the 1893 bridge was short lived, lasting just ten months before reverting solely to rail. It was temporarily jointly used again in 1911, 1912, 1924-25 and 1926-27 while repairs were being carried out to the road bridge. Heavy vehicles were also regularly redirected over the 1893 bridge.

In 1916 the road bridge was rigged with timber gantries to carry power from the new Waddamana hydro-electric power station to Hobart. This was a temporary measure due to a war time delay in shipping of three special towers from England. On arrival, the towers were erected as planned. This included a backstay and 50 metre high tower on the north bank and another straddling the road at the end of the causeway. The towers were replaced with a submarine cable in 1987.[48]

When the Second World War broke out a number of strategic sites were declared, among them the Bridgewater Bridge. It was guarded by a small number of sentries located in temporary buildings off Nielsen Esplanade. By 1941 the road bridge was so rickety that a single lane system with coloured signal lights was brought into operation by the army.[49]

The Current Bridgewater Bridge

Whitlam notes the importance of the development of the Derwent Valley Paper Company in promoting the need for a new bridge at Bridgwater. Indeed, he suggests that had it not been for the Boyer paper operation, the road and rail bridges may never have been combined.[50]

Discussions between the government and the Paper Company began in 1933. To allow for shipping access, the company initially requested a clear opening in the bridge some 18 metres wide. The Public Works Department investigated, and found that modifying the existing bridges for such a width would be very difficult. Further, the existing road bridge had been constructed as the rail bridge in 1874, and although not dangerous, had reached the end of its life. The best solution would be for a new combined road and rail bridge. To maintain the essential transport connections, the new bridge would need to be built between the existing road and rail bridges. With such a constraint and the narrow distance between the two existing bridges, it would not be possible to construct a swing bridge. Initially the department favoured a bascule type of lifting span, but later came to favour a lift span.[51]

Preparatory geotechnical works were carried out in 1933. Boring of the riverbed found a solid rock bottom from 7.3 to 28 metres below the water level. The overlying strata of the bed was largely mud, but clay was also found over the northern half. A basalt base was found on the northern bank of the Derwent, but was underlaid by mud, which would require foundations to descend to a deeper level.

Department engineer and key designer of the bridge Allan Knight and director of Public Works George Balsille toured New South Wales in 1936 visiting a number of different types of moving bridges. Balsille also visited the combined road and rail bridge at Paringa, South Australia. Following the review of how other states had addressed similar problems, the department shifted its position to a lift span structure rather than a bascule arrangement.

A meeting was held with the Hobart Marine Board in April 1936 to determine the required width for the opening of a new structure at Bridgewater. Conflicting advice was given on the tonnage of shipping that would need to pass through the bridge, although it did confirm that a bascule bridge was not suitable. As a result, the preliminary concept was for a lift span bridge to be constructed with a horizontal clearance of 36 metres, and a vertical clearance above the high water mark of 30 metres.[52]

Further geotechnical work was required to determine costs for the piles supporting the lift span as no information was available on the likely behaviour of the mud should bridge cylinders be sunk. Testing was carried out on timber and concrete piles to determine if a satisfactory pile foundation could be constructed. Although timber piles were acceptable from a load point of view, they rapidly deteriorated about the mud line resulting in expensive and frequent renewal.

Initial costings for the new bridge were estimated at £100,000. A further £25,000 was needed when the lift span was widened, whilst the needs of other government departments added a £10,000 to the project. Offsets and savings in the pile testing reduced the final estimate of works to £123,000.

The Parliamentary Standing Committee on public works investigated the project in 1937. The Railways Department estimated that the existing rail bridge had an estimated lifespan of at least 15 years. However, if the road bridge was to be renewed, it was sensible to also replace the rail bridge at the same time. The Paper Company and the Marine Board were in support of an opening at least 30 metres wide, which would provide safe navigation of vessel up to 2,000 tons. They estimated that on establishment of the factory, the mill would be served by 60 to 80 ships.[53]

Public Works submitted plans for a steel and concrete lift bridge with a horizontal opening of 30 metres. The Department was satisfied that the proposed opening would be sufficient for the largest vessels that would need to reach Boyer. The cost of this opening was estimated at £19,800. Cost comparisons were also made on the use of different materials. A new timber bridge was estimated at £70,000 while a bridge in permanent materials would cost £103,500, excluding additional costs for the bridge approaches and incidental works.

[52] GHD, 2009, p.196; Memorandum 1/37, Removal of Bridgewater Bridge, Parliamentary Standing Committee on Public Works, 1937, pp.1-2
[53] GHD, 2009, p.196

The Committee was hesitant to support a project that would result in the demolition of a rail bridge which still had at least a 15 year lifespan left. As a result, the Department were asked to investigate further. They considered the construction of a new road bridge to the east of the existing, while a new rail bridge would be built at the end of its life. It was noted however that having two different bridges with two opening spans would make navigating between the bridges a difficult exercise. Balsille recommended the Department's preferred option of a new combined road and rail bridge, but noted that construction could be postponed until the old rail bridge had reached the end of its life.[54]

The Committee made three key recommendations:

1. Approval of the substructure of a bridge which combined road and rail uses and approval for the superstructure of the road portion including the lift and flanking truss spans. A cost estimate of £103,000 was given for this part of the works.
2. A decision on the superstructure of the rail portion of the bridge (with the exception of the lift and flanking spans) should be deferred until the Paper Company or other industries established that they needed sea going vessels to navigate above Bridgewater, or that the existing rail bridge required replacement; and
3. That before committing addition funds for the construction of the opening span, it was necessary to dredge the Derwent near its junction with the Jordan River.[55]

Construction began in 1937 with preliminary site work, and in January the following year, the acquisition of properties on the bridge approaches. On the Bridgewater side this included demolition of the Railway Hotel, stables and bazaar to make way for the steel fabrication yard and workshop. A nearby 1925 fruit drying factory was rented to provide extra space for the Public Works Department.[56]

It was originally planned that the road bridge would be completed by late 1940. However, the outbreak of the Second World War resulted in the loss of workers and materials, and resources, were instead transferred to completing the Hobart floating bridge. As a result, the Department had difficulties to get tenders for the hoisting material, and the bridge was constructed in a piecemeal manner.[57]

The bridge opened to road traffic in March 1942 once the lift span had been installed, although it was to take several years before the lift span came into operation. It was not until 1951 that the last of the piles from the redundant bridges were removed. The massive concrete filled steel caisson on which the 1893 swing span rotated was left *in situ*, along with the 1893 abutments on the Bridgewater side of the river.[58]

By 1944, demand had grown for newsprint and the government submitted plans for a revised railway station at Bridgewater to supply Boyer. The factory was also examining its transport needs, favouring river transport, but noting that as a temporary measure, a rail siding was also required. In response, the government continued the upgrade of the Bridgewater Station and brought the bridge lift span into operation. The old 1874 rail bridge was retained while these works occurred, allowing for traffic to be diverted to the old structure while completing the lift span towers in 1943-44. In mysterious circumstances, the old rail bridge caught fire in October 1945. The fire brigade were advised to let it burn, reducing demolition costs, but in the end only three spans were destroyed.[59]

Completion of the bridge towers and lifting mechanism were delayed by the Second World War, with the lifting span coming into operation in 1946. On completion, three bridges existed at the crossing: the new steel bridge combining road and rail traffic, and the old separate rail and road bridges. As a result, shipping had to zig-zag between them to navigate up stream.[60]

The new bridge started carrying rail in October 1946, in combination with a new station layout at Bridgewater. On completion, the old rail bridge was progressively demolished. The full width of the opening span was not available until 20 February 1946. It was take four more years before the old piles were removed from the River, the key survivor being the massive steel and concrete caisson which supported the swing span of the 1893 bridge.[61]

The extra costs of the lift span proved a wise investment. By 1946, the Paper Company favoured barging newsprint from Boyer to Hobart. Increased production at the factory resulted in growth in river traffic. In 1947-48, less than 400 vessels made the crossing at Bridgewater, but growing to just over a 1,000 in 1956 and 1,300 by 1969-70. The largest number of openings on a single day was 26 for the New Norfolk Regatta. The only vessels that ever needed the full height of the lifting span were a few of the Sydney-Hobart maxi yachts which ventured this far upstream. River transport to and from Boyer was progressively dropped, ceasing completing in 1986. As a result the number of bridge openings declined markedly. In 1987-88, the bridge opened less than one hundred times.[62]

The combination of road and rail on the bridge required extra safety precautions to be installed to prevent trains crossing the bridge whilst it was lifted. The solution was the interlocking of the power supply for the lifting mechanism and the signal station at the rail station, and human operation of the switches and signals. All physical systems for safe operation of the lift span were replaced with telephone rail orders in the 1980s.[63]

Like all structures, the Bridgewater Bridge has undergone a series of modifications since construction.

In 1951, the renewed Bridgewater railway station and its signalling equipment was destroyed by a fire. At first, the bridge rail locks which lowered and raised the opening span were operated by hand, which could be slow, particularly during high winds. These were later replaced with hydraulic cylinders to operate the locks from the machinery house located above the lift span.

Changing rail demands also led to changes to the Bridge. During the 1960s, railway infrastructure was modified to cope with the heavy loads required for the Gordon Power Development project. At Bridgewater, this required the lowering of the rail tracks by 44.45 cm.[64]

Extra steel plates were welded to the under deck girders between 1987-1989 to increase the load limit of the bridge to its maximum limit. The transmission line towers and cables which ran alongside the bridge and causeway were also removed during this time.

The lift span was also subject to structural changes in the 1980s to increase its load capacity. The works included strengthening of the welded plate girders by the addition of plates to the top and bottom flanges and strengthening of piers by the application of transverse steel beams encased in concrete.

The addition of plates to the top and bottom flanges of the girders had the unintended effect of significantly distorting the girders so that they separated from the bridge deck, and in time causing corrosion. The issue was addressed by the addition of grout into the voids. Additional steel cleats were also added to the deck to provide full lateral restraint of the girders.[65]

In 1992 the southern end of the bridge and the causeway was raised and reconstructed, including some vertical realignment of the causeway over a distance of some 150 metres.[66]

The continued settlement of the causeway has resulted in horizontal displacement of sediments, which in turn apply horizontal loads to the piles. Since construction in 1942, settlement in the order of 60 cm has occurred and continues to be an ongoing issue. [67]

Some of the most significant refurbishment took place during the early 2000s. Substantial deterioration had been identified in 2006 in some of the bridges counterweight ropes, at their connections with the 170 tonne counterweights. Addressing the risk of rope failure, the bridge was closed for a two week period to allow for close inspection and the design of an alternative counterweight suspension system. This alternative system remained in place until 2010 when it was removed as part of the last major refurbishment project. The closure of the lift span temporarily stranded larger vessels upstream.[68]

The temporary support arrangement for the lift span was not a permanent measure. It also made it more difficult to maintain the ropes and other components. Refurbishment of the bridge and restoration of the operation of the opening span was identified as the appropriate response. Works carried out as part of this major refurbishment were extensive, replacing certain equipment, and making repairs and enhancements. Repairs were generally like-for-like to maintain the heritage values of the bridge. It included:

1. Full containment, grit blasting and repainting all plate girder approach spans to safely remove the lead-based paint, rectify steel corrosion and apply a new protective coating;
2. The installation of new cathodic protection[69] systems for the concrete piers. On opening the piers for the repair and installation of the protection system, it was found that not only was there insufficient concrete cover for the installation of a new system, but that the original anodes had damaged the pier reinforcement. The installation of new cathodic protection was therefore abandoned, and work instead focussed on repairing damaged reinforcement and concrete.
3. Structural repair of areas of the steel superstructure and concrete piers, with inclusion of cleats to the plate girders of the approach spans to provide them with full lateral restraint. Additional steel repairs were required including reattachment of a large number of braces to the steel plate girders.
4. Works were proposed to investigate or stabilise settlement of the causeway, although more urgent works were carried out instead.
5. Restoration of the opening lift span and upgrading the electrical and mechanical systems to meet current standards. This included replacement of the motors, a programmable logic control, electro-hydraulic brakes and improved guarding to reduce reliance on manually operated brakes and improve safety.[70]

HERITAGE LISTING

The Bridgewater Crossing including causeway and bridge has been assessed as having State level significance, recognised in its inclusion on the Tasmanian Heritage Register (THR) ID 618. The site is therefore subject to the Historic Cultural Heritage Act 1995 (HCHA 1995).

The Crossing is also included in Table E13.1 of the Heritage Code of the Brighton Interim Planning Scheme 2015 (BIPS 2015) as "Bridgewater Bridge (CT134751/4)".

ASSESSED HISTORIC CULTURAL HERITAGE SIGNIFICANCE

The following assessment of the Bridgewater Crossing including Statement of Significance has been extracted from the *Memorandum: Review of assessment of significance against state criteria/threshold*, prepared by Purcell, dated 12 October 2020:

The Bridgewater Causeway and Bridge forms part of a broader and significant cultural landscape which has historical importance with regard to the evolution of transport, and which concentrates at this point of the Derwent. Serviced first by ferries, then later the causeway, road and rail traffic, the place is arguably the focus of Tasmania's most historically important transport route.

The Bridgewater crossing as a major piece of civil infrastructure forms part of a suite of places including roads, bridges, dams and water supply systems. It is important as one of the largest items of civil infrastructure constructed in Van Diemen's Land using convict labour. The Bridgewater Causeway has the potential to enhance an understanding of early civil engineering construction from the early nineteenth century generally and more specifically a greater understanding of the construction methods employed to address the very difficult geological conditions encountered throughout its history.

The Bridgewater Bridge is rare as Tasmania's only surviving lift span bridge and is the largest surviving lift span bridge in Australia. The steel truss approach and lift spans demonstrate the early use of all welded connections in steel truss bridges and the early adoption in Tasmania of design details specifically to address the issue of fatigue. The Bridgewater Bridge is important in demonstrating the key characteristics of a lift span metal truss rail and road bridge. The extensive archive of construction documentation and engineering studies and has the potential to yield information as to historical advances made in welding details, and their long term performance.

The Bridgewater Causeway has a special association with the work of convict labour in the construction of major civil engineering projects during the first half of the nineteenth century. It is also important for its association with Governor Arthur. The Bridgewater Bridge is an important example of the work of engineer Sir Allan Knight. The place has special associations to Engineers Australia who have recognised its technical significance with an Engineering Heritage National Marker in 2018.

a) "The place is important to the course or pattern of Tasmania's history"

The Bridgewater Causeway and Bridge forms part of a broader and significant cultural landscape which has historical importance with regard to the evolution of transport, and which concentrates at this point of the Derwent.

Serviced first by ferries, then later the causeway, road and rail traffic, the place is arguably the focus of Tasmania's most historically important transport route.

The causeway was one of the largest items of civil infrastructure constructed in Van Diemen's Land using convict labour. It demonstrates the scale of public works that could be carried out by convict labour, which was the key workforce available during the first half of the nineteenth century. The length of time to construct the causeway, and the methods used to address the very difficult geological conditions are a testament to the work carried out by the convict workers.

Following completion, the causeway formed the point of construction for all future bridges. Evidence of the 1874 and 1893 bridges exists on the causeway and northern bank of the Derwent. Subsurface evidence of the 1849 bridge abutments may also exist on the northern bank. The current Bridgewater Bridge is of historical importance in demonstrating the development of civil infrastructure by the Public Works Department, during a period of great innovation and technical advancement in the 1930s.

The bridge is also historically significant with its association with a major phase of industrialisation in Tasmania, and in particular the development of the paper industry in the Derwent Valley. The bridge was specifically designed to help facilitate this industry through the provision of both rail and river navigation capabilities.

b) "The place possesses uncommon or rare aspects of Tasmania's history"

The causeway is a rare place. It is one of only two causeways constructed in the state during the early nineteenth century using convict labour. It is considerably larger in length and volume than the Hunter Island causeway, being the other convict built causeway.

The Bridgewater Bridge was Tasmania's second, and the only surviving lift span bridge. It is also the largest surviving lift span bridge in Australia. It is the largest and one of relatively few metal truss road bridges in Tasmania, and is a relatively early example of an all welded bridge.

c) "The place has the potential to yield information that will contribute to an understanding of Tasmania's history"

The Bridgewater Causeway has archaeological research potential. Detailed documentary evidence of its construction methods is limited. It offers opportunities to understand civil engineering construction from the early nineteenth century and methods to address the very difficult geological conditions over an extended period.

The Bridgewater Bridge has research potential to provide new information on bridge design and construction, and in particular, advances made in welding details, and their long term performance.

d) "The place is important in demonstrating the principal characteristics of a class of place in Tasmania's history"

The Bridgewater Causeway is an important example of large scale civil infrastructure that was built during the first half of the nineteenth century using convict labour. It forms part of a suite of places including roads, bridges, dams and water supply systems.

The Bridgewater Bridge is important in demonstrating the key characteristics of a lift span metal truss road bridge. It is a 'Pratt' type of truss in a half-through configuration. The truss consists of vertical diagonals that slope down towards the centre. Constructed from welded steel, the bridge demonstrates the essential truss form of light weight construction with a hollow skeletal structure formed from vertical, horizontal and diagonal chords creating the essential triangular section of the truss bridge type.

e) "The place is important in demonstrating a high degree of creative or technical achievement"

The Bridgewater Bridge is important in demonstrating a high degree of technical achievement. The steel truss approach spans and the lift span demonstrate the early use of all welded connections in steel truss bridges and the early adoption of design details specifically to address the issue of fatigue. It was designed and constructed some ten years after the world's first all welded bridge, and within a number of years of Tasmania's entry into this technology. Recent investigations have shown that some of the details originally incorporated to reduce susceptibility to metal fatigue are now considered susceptible to fatigue.

Innovative research was carried out and the weld details were designed to address problems with fatigue and brittle fracture.

f) "The place has a strong or special association with a particular community or cultural group for social or spiritual reasons"

No social values assessment has been carried out for this project. The following provides an indicative statement of values which may exist at the place.

The Bridgewater Causeway and Bridge are prominent landmarks and mark the northern entrance to Hobart. It has been the key crossing point of the Derwent since the 1830s.

The causeway and bridge may have strong or special associations with engineers as a group. Engineers Australia has recognised the Bridge with an Engineering Heritage National Marker in 2018.

g) "The place has a special association with the life or works of a person, or group of persons, of importance in Tasmania's history"

The Bridgewater Causeway has a special association with the work of convict labour in the construction of major civil engineering projects during the first half of the nineteenth century. It is among the largest items of infrastructure in Tasmania which demonstrates this association. The causeway is also important for its association with Governor Arthur and various government engineers and officials who designed and oversaw its construction. This includes Inspector of Roads and bridges Roderic O'Connor, and architect and engineer John Lee Archer. The Bridgewater Bridge is an important example of the work of engineer Sir Allan Knight. Knight enjoyed a highly successful career with the Public Works Department and later the Hydro Electric Commission.

He was the designer of a number of technologically advanced bridges including at Vincents Rivulet and the Leven River, and was closely involved with the three bridges across the Derwent – the floating bridge at Hobart, Bridgewater Bridge and the Tasman Bridge. Knight received many awards and honours during his career and was made a Knight Bachelor in 1970.

h) "The place is important in exhibiting particular aesthetic characteristics"

The Bridgewater Bridge is the dominant visual landmark in an aesthetically important cultural landscape, strongly associated with the evolution of transport. This evidence is layered in the landscape, and includes large and small elements.

The bridge with its high towers and distinctive truss forms are landmarks of the area, with important views to the structure available from surrounding road networks.

The still waters of the Derwent at this location and frequent presence of large flocks of Black Swans contribute to the setting of the place.

PHOTOGRAPHIC DOCUMENTATION

CAMERA AND LENS SPECIFICATIONS

The photographs that form this Archival Record were taken with a 50mm camera digital equivalent, meeting the requirements of the NSW Heritage Office Guidelines for Photographic Recordings. The camera and lens specifications are as follows:

Camera Canon 7D Digital SLR (18 Megapixel)

Lens Canon 70-200mm, 50mm

IMAGE FORMAT

The photographs were taken at 18 megapixels in RAW format and converted to high resolution TIF format (approx. 3MB to 6MB each), in accordance with the NSW Heritage Office Guidelines for Archival and Photographic Recordings. The digital copies of this Archival Record comprise each photograph in both RAW, TIF and JPEG format, as well as thumbnail sheets with reference numbers.

PHOTOGRAPHIC CATALOGUE

This Archival Record comprises the following sections, consistent with the NSW Heritage Office Guidelines:

- Plan Sheets – documenting the location of each photograph using markers (Appendix 1);
- Catalogue Sheets – comprising detailed descriptions of each photograph, orientation of photographs and cross-references to both plan sheets and thumbnail images (Appendix 2);
- Thumbnail Sheets – comprising a thumbnail of each photograph and reference numbers (Appendix 3);
- Selection of Photographs – comprising a selection of photographs that capture the Crossing and setting (Appendix 4);
- Historic Photographs & Drawings – a selection of historic photographs sourced from Libraries Tasmania and original and early drawings of the bridge sourced from the Department of State Growth comprising survey, plan, elevation, section and detail drawings (Appendix 5), and;
- Point Cloud Survey, Sample Views – prepared by JACOBS and comprising sample views of the model (Appendix 6).

DISTRIBUTION

Digital copies of this Archival Record are to be distributed to the Department of State Growth, Heritage Tasmania and the Tasmania Heritage and Archive Office.

NOTES
1. All shimming to be placed between Flat jack and Plate Mk H
2. Assembled height of falsework Pier 4 - 2 195
Pier 6 - 2 345

The concrete shall be to be in accordance with the Specifications for Ready Mixed Concrete Metric Units December 1974, and as may be subsequently amended.

Minimum design mean compressive strength (D.M.C.S.) determined by 28-day compression tests on cylindrical specimens shall be as follows:

Grade F'c MPa	D.M.C.S. MPa	Spec. Slump mm	Location in structure
20	27	50	Stem

1. All exposed edges to be chamfered 20mm unless otherwise shown.
2. All steel reinforcement 12 mm diameter and over to be structural grade deformed bars unless otherwise shown.
3. The designing engineer shall ensure that backfilling, and filling generally around substructure units together with rock packing and c-c-t packing requirements are conducted on the road plans. The engineer supervising the construction shall ensure that this work is done to his satisfaction and as specified.
4. Road plans:
5. Bench mark:
6. Design loading to be marked onto inside face of U.S. kerb at Abutment A end
7. Year of construction to be marked onto inside face of D.S. kerb at Abutment A end
8. Bridge number to be marked onto outside face of D.S. kerb at Abutment A end
9. Bridge number to be marked onto outside face of D.S. kerb at Abutment A end
10. If any doubt exists in the field or workshop about information on the drawings, the matter shall be referred to construction supervisors with the Division Engineer, Bridges for clarification. No work shall proceed if in doubt.

GENERAL NOTES

STRUCTURAL STEEL

1. ALL STRENGTHENING STEEL TO BE GRADE 250LO.
2. ALL TEMPORARY WORKS STEEL TO BE GRADE 250.

WELDING

1. ALL WELDING TO BE S.P. CATEGORY IN ACCORDANCE WITH AS1554 , PART 1.
2. ALL ELECTRODES FOR FILLET WELDS TO BE E48XX.
3. ALL FULL PENETRATION BUTT WELDS TO DEVELOP THE FULL STRENGTH OF 250LO STEEL.
4. ALL FILLET WELDS TO BE 6mm U.N.O.

DIMENSIONS

1. ALL KEY DIMENSIONS TO BE CHECKED ON SITE PRIOR TO STEEL FABRICATION COMMENCING.

NOTES
1. Footing, column and beam details on drg Sh N°-7
2. Design bearing pressure for footing is 150 KPa. Footings shall not be constructed on filled ground unless approved by Engineer.
3. Concrete grade 32 + blinding concrete grade 15
4. Refer to spec for protective treatment to gantry members.
5. All steelwork shall be AS 3679 1990 grade 250.
6. The columns + beam of the gantry shall be applied top coating of bronze olive colour
7. All bells shall be applied top coating as shown with alternate stripes of red + white paint.

Note : Levels obtained from level book 142 B.

1. The concrete mix is to be in accordance with the specifications for Ready Mixed Concrete Metric Units December 1974, and as may be subsequently amended.
   Minimum design mean compressive strength (D M C S) determined by 28-day compression tests on cylindrical specimens shall be as follows

Grade F'c MPa	D M C S MPa	Spec. Slump mm	Location in structure

2. All exposed edges to be chamfered 20mm unless otherwise shown.
3. All steel reinforcement 12 mm diameter and over, to be structural grade deformed bars unless otherwise shown.
4. The designing engineer shall ensure that backfilling, and filling generally around substructure units together with rock pitching and rock pitching requirements are endorsed on the road plans. The engineer supervising the construction shall ensure that this work is done to his satisfaction and as specified.
5. Road plans.
6. Bench mark.
7. Design loading to be marked into inside face of U.S. kerb at Abutment A end.
8. Year of construction to be marked into inside face of D.S. kerb at Abutment A end.
9. Bridge number to be marked into outside face of D.S. kerb at Abutment A end.
10. If any doubt exists in the field or workshop about information on the drawing, the matter shall be reviewed by construction supervisors with the Division Engineer Bridges for clarification. No work shall proceed if in doubt.

Reduced Level (metres) - A.H.D

1. THE CONCRETE MIX IS TO BE IN ACCORDANCE WITH THE SPECIFICATIONS FOR READY MIXED CONCRETE METRIC UNITS - DECEMBER 1974, AND AS MAY BE SUBSEQUENTLY AMENDED. MINIMUM DESIGN MEAN COMPRESSIVE STRENGTH @ 28 DAYS DETERMINED BY 28-DAY COMPRESSION TESTS ON CYLINDRICAL SPECIMENS SHALL BE AS FOLLOWS:

GRADE f'c MPa	D.M.C.I. MPa	SPEC. SLUMP mm	LOCATION IN STRUCTURE

2. ALL EXPOSED EDGES TO BE CHAMFERED 20mm UNLESS OTHERWISE SHOWN.

3. STEEL REINFORCEMENT 12mm DIA AND OVER TO BE "TEMPCORE" DEFORMED BARS UNLESS OTHERWISE SHOWN.
4. THE DESIGNING ENGINEER SHALL ENSURE THAT BACKFILLING AND FILLING GENERALLY AROUND SUBSTRUCTURE UNITS TOGETHER WITH ROCK PACKING AND ROCK PITCHING REQUIREMENTS ARE ENDORSED ON THE ROAD PLANS. THE ENGINEER SUPERVISING THE CONSTRUCTION SHALL ENSURE THAT THIS WORK IS DONE TO HIS SATISFACTION AND AS SPECIFIED.
5. ROAD PLANS
6. BENCH MARK.
7. DESIGN LOADING TO BE MARKED INTO INSIDE FACE OF D.S. KERB AT ABUTMENT A END.
8. YEAR OF CONSTRUCTION TO BE MARKED INTO INSIDE FACE OF D.S. KERB AT ABUTMENT A END.
9. BRIDGE NUMBER TO BE MARKED INTO OUTSIDE FACE OF D.S. KERB AT ABUTMENT A END.
10. IF ANY DOUBT EXISTS IN THE FIELD OR WORKSHOP ABOUT INFORMATION ON THE DRAWING, THE MATTER SHALL BE REVIEWED BY CONSTRUCTION SUPERVISORS WITH THE DIVISION ENGINEER, BRIDGES FOR CLARIFICATION. NO WORK SHALL PROCEED IF IN DOUBT.

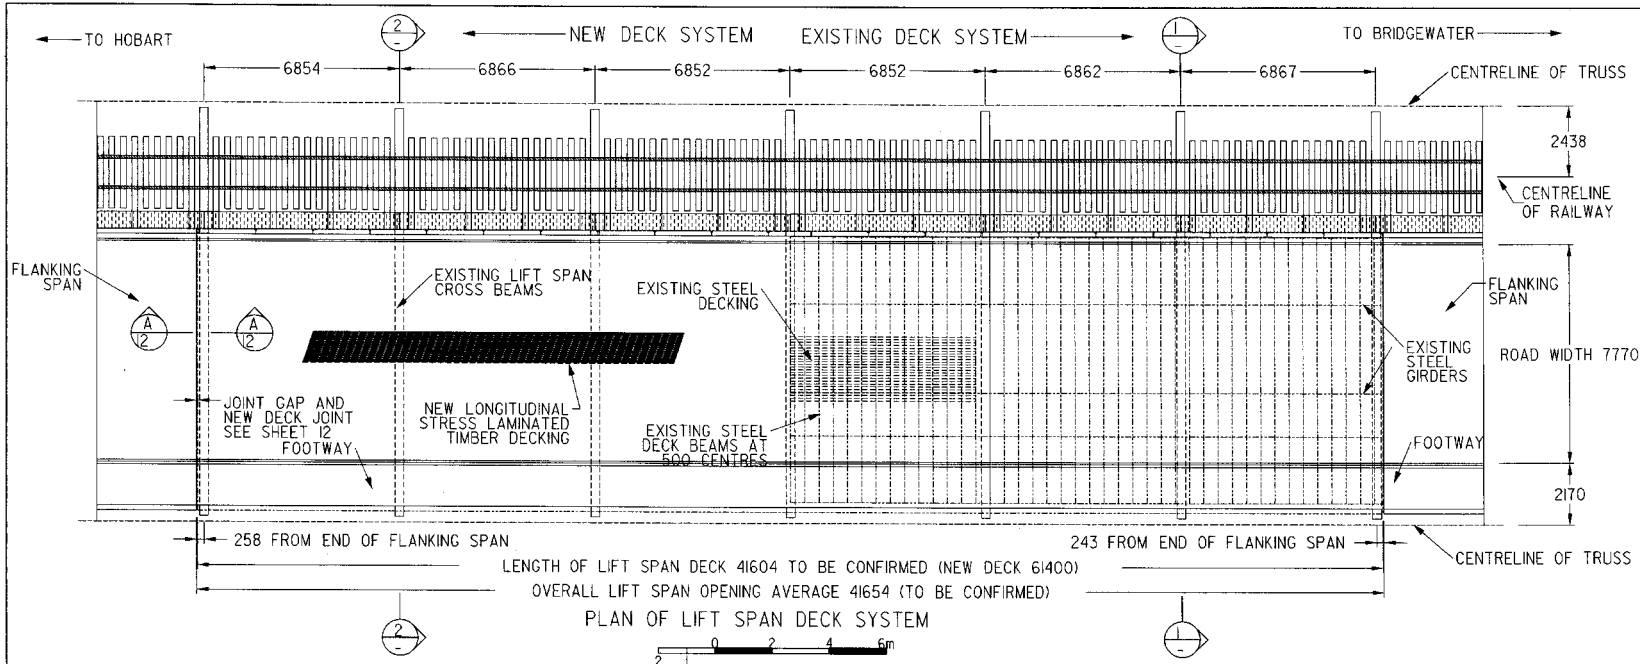
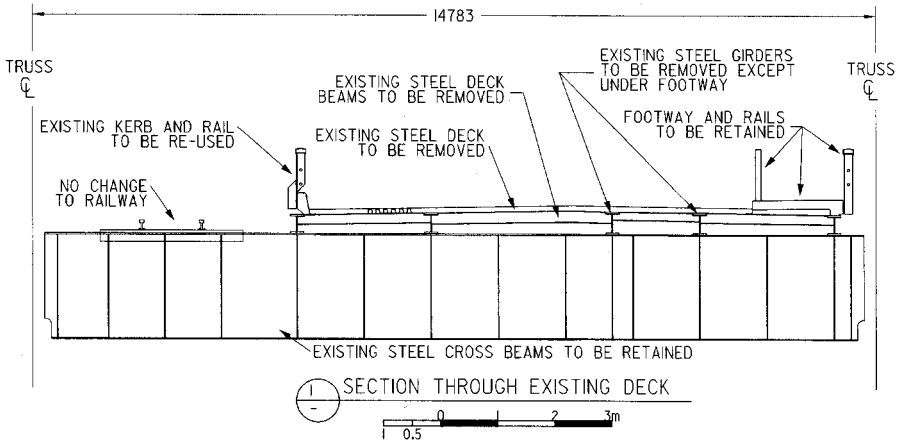
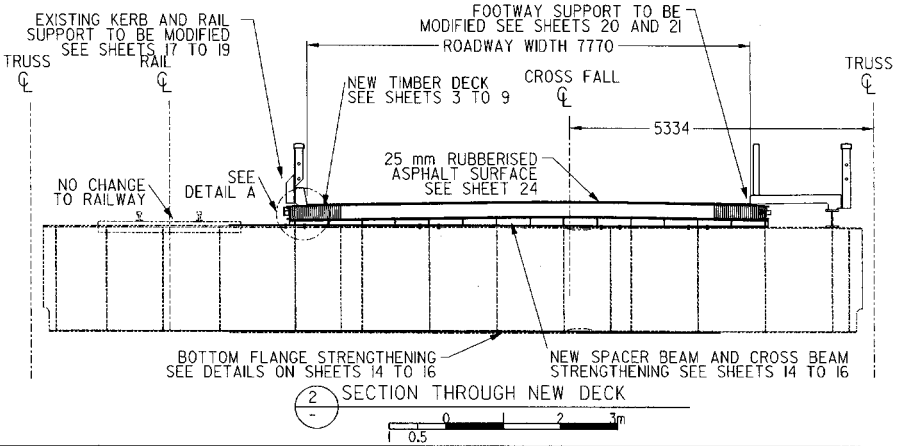
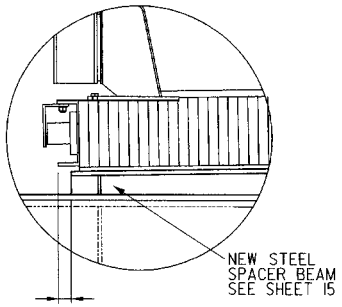
SHEET No 1 No. OF SHEETS 28

(DIER) 15 D8-01









DETAIL A - TRANSVERSE DECK POSITION

0 200 400 600
200 100

GENERAL NOTES

SCALES AS SHOWN
DIMENSIONS ARE IN MILLIMETRES EXCEPT THAT WHERE IMPERIAL MEASURE IS GIVEN IT SHALL BE CONSIDERED AS CONTROLLING.
ALL MATERIAL QUANTITIES SHALL BE AS SPECIFIED ON SHEET 28

THE EXISTING STEEL DECKING AND LONGITUDINAL STEEL GIRDERS UNDER THE ROADWAY ARE TO BE REPLACED WITH A NEW STRESS LAMINATED TIMBER DECK AS OUTLINED IN THESE DRAWINGS.

THE NEW STRESS LAMINATED TIMBER DECK IS TO BE CONSTRUCTED AS SPECIFIED ON SHEET 3. THE CONTRACTOR MAY CHOOSE ONE OF THE FOUR TIMBER LAMINATE OPTIONS OUTLINED ON SHEETS 5 THROUGH 9.

THE EXISTING STEEL CROSS BEAMS ARE TO BE STRENGTHENED AS AS SPECIFIED ON SHEETS 14 THROUGH 16.

THE EXISTING RAILWAY SIDE KERB AND RAILING SYSTEM IS TO BE REMOVED AND MODIFIED AS SPECIFIED ON SHEETS 17 TO 19.

THE EXISTING FOOTWAY AND RAILING SYSTEM IS TO BE LEFT IN PLACE AND MODIFIED AS SPECIFIED ON SHEETS 20 AND 21.

THE NEW TIMBER DECK IS TO BE PREFABRICATED OFF THE ROADWAY ON THE NORTHERN APPROACH TO THE BRIDGE AND THEN LAUNCHED INTO POSITION AS OUTLINED ON SHEETS 24 TO 27.

DURING THE REMOVAL OF THE OLD DECK AND INSTALLATION OF THE NEW DECK THE EXISTING FOOTWAY SHALL BE SUPPORTED AS SPECIFIED ON SHEETS 22 AND 23.

THE NEW DECK SHALL BE POSITIONED WITH REFERENCE TO THE RAILWAY SIDE OF THE BRIDGE AS SHOWN IN DETAIL A. VARIATION IN THE DECK WIDTH, WITHIN THE LIMITS GIVEN ON SHEET 3, SHALL BE ACCOMMODATED UNDER THE FOOTWAY.

DIMENSIONS ARE IN MILLIMETRES
THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS II AND 28.
MATERIAL QUANTITIES AND PROTECTIVE TREATMENTS SHALL BE AS SPECIFIED ON SHEET 28.

UNLESS APPROVED OTHERWISE THE DECK SHALL BE INSTALLED IN ITS FINAL POSITION ON THE LIFT SPAN OF THE BRIDGE BEFORE ANY DRILLING OR REBATING OF THE TIMBER IS PERFORMED.
THE LOCATIONS OF THE PRESTRESSING STRANDS SHALL BE ACCURATELY AND CLEARLY MARKED ON THE TOP SURFACE OF THE TIMBER BEFORE ANY DRILLING IS PERFORMED.
EXCEPT AS MAY BE NOTED ON THESE SHEETS NO HOLES SHALL BE DRILLED WITHIN 70 mm OF ANY STRAND. WHERE DRILLING WITHIN THIS CLEARANCE IS ALLOWED THE CLEARANCE FROM THE PRESTRESSING STRAND SHALL BE CONFIRMED AND APPROVAL SHALL BE OBTAINED BEFORE DRILLING IS COMMENCED.
THE POSITION OF ALL TIE DOWNS IS GIVEN WITH RESPECT TO THE WEB STIFFENERS IN THE NEW SPACER BEAMS. THE CLIP PLATES (P4 TO P6) SHALL BE LOCATED AS CLOSE AS POSSIBLE TO THE SPACER BEAM

TIGHTENING OF TIE-DOWNS

ALL TIE DOWNS SHALL BE INSTALLED WITH 1½ THREADS PROTRUDING BEYOND THE BOTTOM NUT. AN APPROVED THREAD LOCKING FLUID SHALL BE APPLIED TO THE BOTTOM NUT, TIGHTENING SHALL BE PERFORMED AS OUTLINED ON SHEET II.

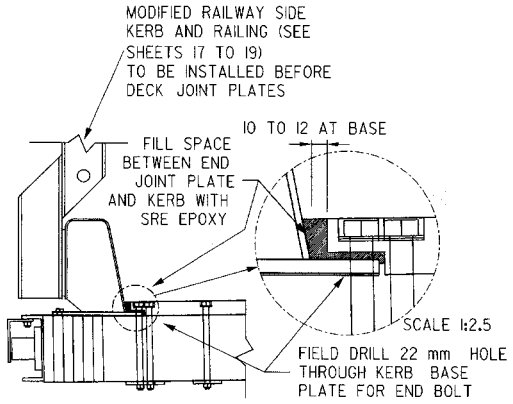
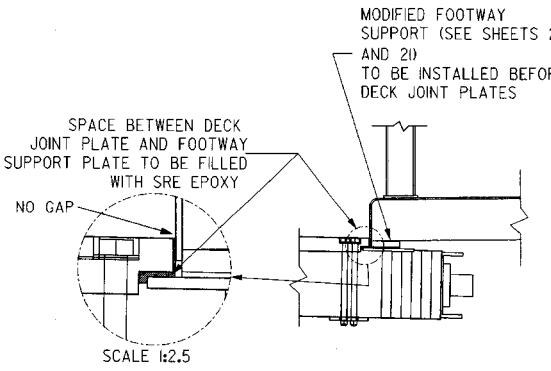
1/- PLAN VIEW OF END DECK JOINTS

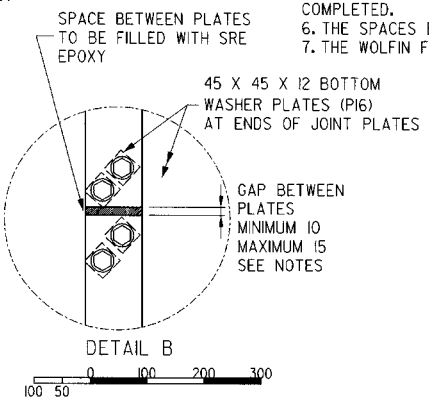
SCALE 0 50 100 150 (50 25)



3/- DECK JOINT ATTACHMENT AT KERB



4/- DECK JOINT ATTACHMENT AT FOOTWAY



DETAIL B

SCALE 0 100 200 300 (100 50)

GENERAL NOTES

SCALE 0 200 400 600 (200 100) EXCEPT AS NOTED

DIMENSIONS ARE IN MILLIMETRES
THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS 13 AND 28.
MATERIAL QUANTITIES AND PROTECTIVE TREATMENT SHALL BE AS SPECIFIED ON SHEET 28.
NEOPRENE WASHERS (N4) SHALL BE AS SPECIFIED ON SHEET 28.

WORK TO BE COMPLETED BEFORE DECK JOINT INSTALLATION

THE DECK JOINT PLATES SHALL NOT BE FITTED UNTIL THE FOLLOWING WORK HAS BEEN COMPLETED:
1. THE DECK HAS BEEN INSTALLED ON THE LIFT SPAN AND TIED DOWN TO THE SUPPORTING CROSS BEAMS AS SPECIFIED ON SHEETS 10 AND 11
2. THE RAILWAY SIDE KERB HAS BEEN INSTALLED AS SPECIFIED ON SHEETS 17 TO 19
3. THE FOOTWAY SUPPORT HAS BEEN INSTALLED AS SPECIFIED ON SHEETS 20 AND 21.

FITTING OF DECK JOINT PLATES

THE PLATES SHALL BE LAYED OUT ON THE ENDS OF THE DECK IN THE ORIENTATION SHOWN ON THIS SHEET WITHOUT DRILLING OR REBATING UNTIL ALL PLATES HAVE BEEN FITTED.
PLATES P12 AND P14 SHALL BE TIGHT AGAINST THE FOOTWAY AS SHOWN IN SECTION 4-4. THE ENDS OF PLATES P9 AND P13 SHALL BE SPACED ABOUT 10 TO 12 mm FROM THE BASE OF THE RAILWAY SIDE KERB AS SHOWN IN SECTION 3-3.
THE INTERMEDIATE PLATES SHALL BE SPACED ACROSS THE WIDTH OF THE DECK TO PROVIDE A EQUAL GAP BETWEEN ALL PLATES.
THE PLATES SHALL THEN BE MARKED FOR LOCATION AND ALL HOLES SHALL BE DRILLED.
THE TOP SURFACE OF EACH PLATE SHALL BE CHECKED FOR ELEVATION WITH RESPECT TO THE ADJACENT FLANKING SPAN.
EACH PLATE SHALL BE REBATED INTO THE TIMBER DECK SO THAT THE TOP SURFACE WILL BE FLUSH WITH THE ROAD SURFACE OF THE FLANKING SPAN, IMMEDIATELY ADJACENT TO THE PLATE, ALLOWING FOR A THIN LAYER OF SRE EPOXY UNDER THE PLATE.

INSTALLATION AND TIGHTENING OF DECK JOINT PLATES

EACH PLATE SHALL BE INSTALLED USING THE FOLLOWING PROCEDURE. (IT SHOULD BE NOTED THAT A LIMITED TIME IS AVAILABLE BEFORE THE SRE EPOXY BEGINS TO CURE):

1. EACH PLATE SHALL BE "DRY FITTED" WITHOUT THE USE OF SRE EPOXY AND THE FOLLOWING CONDITIONS CHECKED:
   - TOP SURFACE LEVEL CHECKED AGAINST THE FLANKING SPAN (ALLOWING FOR EPOXY)
   - BOLT LENGTHS CHECKED FOR ADEQUATE THREAD LENGTH
   - WASHER PLATES CHECKED FOR CLEARANCE
2. ONLY ENOUGH SRE EPOXY SHALL BE MIXED FOR ONE PLATE AT A TIME AND AN EVEN LAYER SHALL BE APPLIED TO THE DECK SURFACE.
3. THE PLATE SHALL BE IMMEDIATELY PLACED IN POSITION AND ALL BOLTS, WASHERPLATES AND NUTS INSTALLED WITHOUT TIGHTENING.
4. IN SEQUENCE FROM ONE END TO THE OTHER, AND REPEATING FROM THE SAME END EACH TIME, ALL BOLTS SHALL BE TIGHTENED AS OUTLINED BELOW, EXCEPT THAT TIGHTENING SHALL STOP IF THE TOP SURFACE OF THE PLATE MATCHES THE ADJACENT FLANKING SPAN:
   - FINGER TIGHT
   - SNUG (1/4 TURN)
   - SNUG TIGHT TO AS4100
   - SNUG TIGHT + 1/4 TURN
5. IF THE TOP SURFACE OF THE PLATE MATCHES THE ADJACENT FLANKING SPAN BEFORE THE FINAL TENSIONING IS ACHIEVED THE SRE EPOXY SHALL BE ALLOWED TO FULLY CURE BEFORE TIGHTENING IS COMPLETED.
6. THE SPACES BETWEEN ADJOINING JOINT PLATES SHALL BE FILLED WITH SRE EPOXY
7. THE WOLFIN FLASHING SHALL BE ATTACHED TO THE ENDS OF THE DECK AS SHOWN IN SECTION 2-2.

DIMENSIONS ARE IN MILLIMETRES EXCEPT THAT WHERE IMPERIAL MEASURE IS GIVEN IT SHALL BE CONSIDERED AS CONTROLLING. THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS 15, 16 AND 28.

THE EXISTING CROSS BEAMS SHALL BE PREPARED FOR STRENGTHENING AS OUTLINED ON THIS SHEET. PREPARATION OF A CROSS BEAM, (AND STRENGTHENING AS OUTLINED ON SHEET 15), SHALL BE COMMENCED AS SOON AS THE EXISTING STEEL DECKING HAS BEEN REMOVED AND THE CROSS BEAM HAS BEEN EXPOSED.

ANY EXISTING PROTRUSIONS OR ATTACHMENTS TO THE TOP FACE OR EDGES OF THE TOP FLANGE AND BOTTOM FACE OR EDGES OF THE THE BOTTOM FLANGE SHALL BE REMOVED.
LOOSE SCALE SHALL ALSO BE REMOVED FROM THESE SURFACES BY GRINDING USING AN APPROVED CONTAINMENT METHOD TO PREVENT CONTAMINATION OF THE ENVIRONMENT.

DURING THE CUTTING OF THE EXISTING TAPERED PLATES, AS SHOWN IN SECTION 3-3, CARE SHALL BE TAKEN NOT TO DAMAGE THE EXISTING FLANGE PLATE UNDERNEATH.

THE 6 mm FILLET WELD SHOWN IN SECTION 4-4 SHALL BE APPLIED TO SEAL THE EXPOSED INTERFACE BETWEEN THE TAPERED PLATES AND THE FLANGE PLATE.
THE WELD CATEGORY SHALL BE GP IN ACCORDANCE WITH AS1554 PART 1.

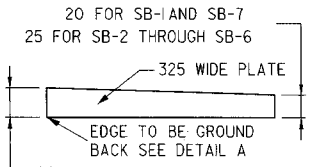
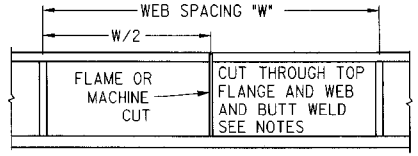
DIMENSIONS TABLE (* SEE NOTES FOR d2)



DETAIL B



DETAIL C - FIELD CUT OF SPACER BEAM

GENERAL NOTES

SCALE 0 50 100 150 (50 25) EXCEPT AS NOTED

DIMENSIONS ARE IN MILLIMETRES EXCEPT THAT WHERE IMPERIAL MEASURE IS GIVEN IT SHALL BE CONSIDERED CONTROLLING
THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS 14, 15 AND 28.
MATERIAL QUANTITIES AND PROTECTIVE TREATMENT SHALL BE AS SPECIFIED ON SHEET 28.
STEEL PLATES SHALL BE TO AS3678 FOR GRADE 250.

WELD CATEGORY SHALL BE SP IN ACCORDANCE WITH AS1554 PART 1.
ALL BUTT WELDS SHALL DEVELOP THE FULL STRENGTH OF THE 250 GRADE STEEL.

IT SHOULD BE NOTED THAT THE DIMENSION "d2" IS DERIVED FROM THE CHANGE IN GEOMETRY OF THE TOP PLATE OF THE SPACER BEAM PLUS THE 1/4" STEP IN THE BOTTOM PLATES. THEREFORE "d2" IS ACTUALLY GREATER THAN "d1" BY 24 mm + 1/4" (OR EXACTLY 30.35 mm).

SEATING OF SPACER BEAMS AND FIELD CUTTING

THE BOTTOM FLANGE OF THE SPACER BEAMS SHALL MATCH ANY EXISTING CAMBER IN THE CROSS BEAMS IN ACCORDANCE WITH THE TOLERANCES SPECIFIED IN AS4100.
THE TOP FLANGE AND WEB OF THE SPACER BEAMS MAY BE CUT IN THE FIELD, AS SHOWN IN DETAIL C, TO RELIEVE DISTORTION AND ASSIST IN SEATING OF THE SPACER BEAM ON THE CROSS BEAM. THESE CUTS SHALL BE BUTT WELDED TO THE SATISFACTION OF THE SUPERINTENDENT. A MAXIMUM OF THREE CUTS SHALL BE ALLOWED IN EACH SPACER BEAM AND SHALL ALWAYS BE POSITIONED MIDWAY BETWEEN THE 12 mm WEB STIFFENERS.
NOTWITHSTANDING THESE NOTES THE CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING SATISFACTORY SEATING OF THE SPACER BEAMS ON THE CROSS BEAMS.

GENERAL NOTES

SCALE 0 400 800 1200 EXCEPT AS NOTED
400 200

DIMENSIONS ARE IN MILLIMETRES
THESE NOTES SHALL BE READ IN CONJUNCTION WITH THOSE ON SHEETS 22 AND 28.
MATERIAL QUANTITIES SHALL BE AS SPECIFIED ON SHEET 28.

TIMBER COMPONENTS

ALL TIMBER COMPONENTS SHALL BE F14 (GREEN) HARDWOOD TO AS 1720. DUE TO THE TEMPORARY NATURE OF THE APPLICATION THE TIMBER DOES NOT NEED SEASONING. THE COMPONENTS MAY BE ROUGH SIZED TO WITHIN +/- 2 mm OF THE SPECIFIED CROSS SECTIONS.
THE CONTRACTOR MAY UTLISE DRESSED MATERIAL SIZES EXCEPT THAT COMPONENT A16 SHALL HAVE A FINISHED THICKNESS OF 50 mm.

STEEL COMPONENTS

ALL STEEL PLATE SHALL BE TO AS3678 FOR GRADE 250 AND STEEL CHANNEL SHALL BE TO AS3679 FOR MINIMUM GRADE 300. DUE TO THE TEMPORARY NATURE OF THE APPLICATION THE STEEL NEED NOT BE PROTECTIVE TREATED.

WELD CATEGORY SHALL BE SP IN ACCORDANCE WITH AS1554 PART 1

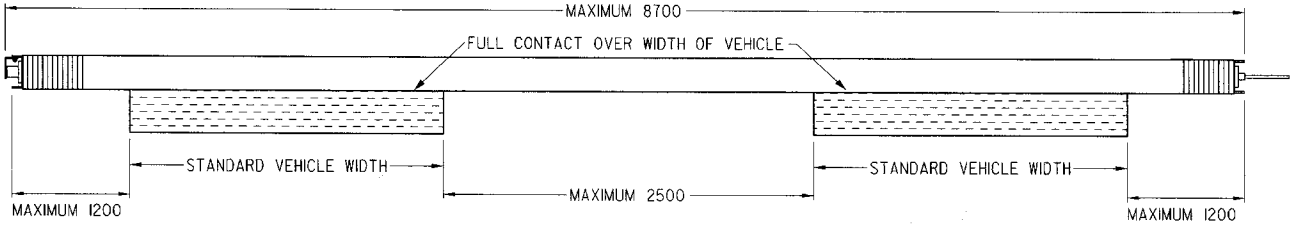
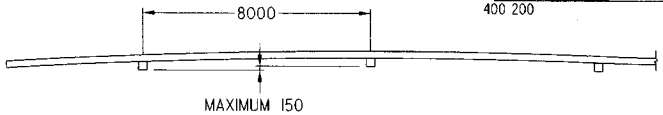
ALLOWABLE LONGITUDINAL SPACING OF SUPPORTS DURING TRANSPORT

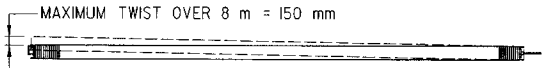
ALLOWABLE TRANVERSE SUPPORT DURING TRANSPORT



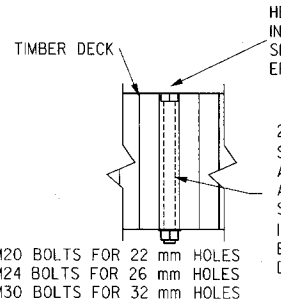
ALTERNATE TRANVERSE SUPPORT DURING TRANSPORT



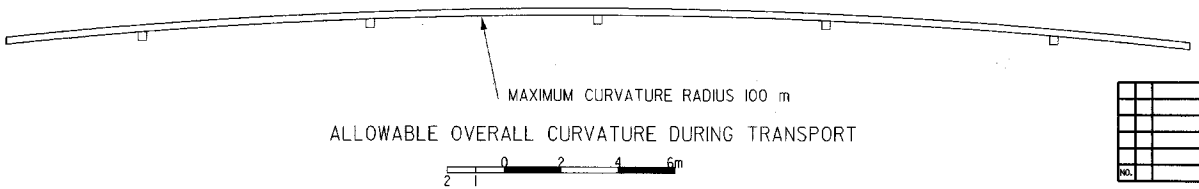
ALLOWABLE DIFFERENTIAL DISPLACEMENT DURING TRANSPORT



ALLOWABLE TWIST DURING TRANSPORT



PLUGGING OF TEMPORARY HOLES



ALLOWABLE OVERALL CURVATURE DURING TRANSPORT

GENERAL NOTES

SCALES AS SHOWN
DIMENSIONS ARE IN MILLIMETRES
THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS 25 THROUGH 28.
THE TEMPORARY MATERIALS SHOWN ON THIS SHEET ARE NOT PROVIDED IN THE MATERIALS LIST ON SHEET 28.

THE CONTRACTOR SHALL BE RESPONSIBLE FOR DESIGNING THE METHOD OF LOADING, TRANSPORT AND UNLOADING FOR THE NEW TIMBER DECK FROM THE ASSEMBLY AREA TO THE FLANKING SPAN READY FOR LAUNCHING.

NOTWITHSTANDING THE DETAILS PROVIDED ON SHEETS 24 THROUGH 27 THE CONTRACTOR SHALL ASSESS THE LAUNCHING AND INSTALLATION METHOD TO ENSURE THEY ARE ACCEPTABLE FOR HIS PURPOSES. THE DETAILS OF THE METHOD AND EQUIPMENT SHALL BE SUBMITTED FOR APPROVAL.

DECK SUPPORT DURING TRANSPORT

DURING LOADING, TRANSPORT AND UNLOADING THE DECK SHALL BE SUPPPORTED ALONG ITS LENGTH AT INTERVALS OF NOT MORE THAN 8 m WITH END CANTILEVERS OF NOT MORE THAN 5 m.

EXCEPT AS NOTED BELOW, EACH OF THESE SUPPORTS SHALL BE CONTINUOUS OVER THE WIDTH OF THE DECK EXCEPT THAT THE EDGE OF THE DECK SHALL NOT CANTILEVER MORE THAN 1.5 m. WHERE A STEEL BEAM IS USED, COMBINED WITH A SUPPORT VEHICLE WIDTH OF 3 m, THE RECOMMENDED MINIMUM SECTION PROPERTIES OF THE BEAM SHALL BE AS SPECIFIED ON THIS SHEET. A SINGLE SUPPORT VEHICLE WIDTH OF LESS THAN 3 m IS NOT RECOMMENDED IN ORDER TO MAINTAIN STABILITY.

WHERE TWO VEHICLES (SIDE BY SIDE) ARE USED THE TRANSVERSE SUPPORTS MAY BE PROVIDED IN TWO LENGTHS AS SHOWN ON THIS SHEET. THE DECK NEED NOT BE TRANSVERSLEY STIFFENED.

ADDITIONAL TEMPORARY DECK ATTACHMENTS FOR LIFTING

ATTACHMENTS FOR LIFTING DEVICES MAY BE INSTALLED BY DRILLING HOLES OF NOT MORE THAN 22 mm DIAMETER THROUGH THE TIMBER DECK. THESE HOLES SHALL NOT BE CLOSER THAN 100 mm TO ANY PRESTRESSING STRAND AND SHALL BE PLUGGED AFTER USE WITH AN M20 X 240 BOLT AS SHOWN ON THIS SHEET. THE LOCATION OF THESE HOLES SHALL NOT CONFLICT WITH PERMANENT ATTACHMENTS OR SUPPORTS.

ALLOWABLE DEFORMATIONS DURING TRANSPORT

THE NEW TIMBER DECK IS STRONG AND FLEXIBLE AND DOES NOT NEED TO BE TRANPORTED IN A LEVEL PLANE. DURING LOADING, TRANSPORT AND UNLOADING THE DECK CAN SUSTAIN DIFFERENTIAL AND TORSIONAL DEFORMATIONS WITHIN THE LIMITS SPECIFIED ON THIS SHEET.

GENERAL NOTES

SCALES AS SHOWN
DIMENSIONS ARE IN MILLIMETRES
THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS 24 AND 26 THROUGH 28.
EXCEPT AS NOTED ON THIS SHEET THE MATERIAL QUANTITIES AND PROTECTIVE TREATMENT SHALL BE AS SPECIFIED ON SHEET 28.

DECK LAUNCH POSITION

THE TIMBER DECK SHALL BE TRANSPORTED TO THE FLANKING SPAN AS SPECIFIED ON SHEET 24.
THE DECK AND ROLLERS ON THE FLANKING SPAN SHALL BE POSITIONED AS SHOWN ON THIS SHEET.
THE DECK SHALL BE LAUNCHED AS SPECIFIED ON SHEET 26.

ROCKER ROLLERS ON THE LIFT SPAN

THE ROLLERS ON THE LIFT SPAN SHALL BE INSTALLED USING THE LAUNCHING AND JACKING BRACKETS A8 AS SHOWN IN SECTION 3-3. THESE ARE REQUIRED FOR CROSS BEAMS B THROUGH F ONLY. HARDWOOD TIMBER BLOCKING SHALL BE USED TO SET THE ROLLERS AT AN ELEVATION WHICH WILL MATCH THOSE ON THE FLANKING SPAN. THIS BLOCKING SHALL BE SECURED (AS ONE UNIT) TO THE BRACKETS AS SPECIFIED ON THIS SHEET. THE BLOCKING SHALL CONSIST OF AT LEAST TWO LAYERS OF TIMBER ORIENTED IN OPPOSITE DIRECTIONS.

ATTACHMENT HOLES FOR LAUNCHING

THE LAUNCH ATTACHMENT HOLES SHALL BE 32 mm DIAMETER FOR M30 BOLTS AS SPECIFIED ON THIS SHEET. THESE HOLES SHALL BE PLUGGED AFTER USE USING M30 X 250 BOLTS AS SHOWN ON SHEET 24.

LATERAL MOVE OF DECK UNDER FOOTWAY TO FINAL POSITION

0 500 1000 1500
500 250

GENERAL NOTES

SCALES AS SHOWN
DIMENSIONS ARE IN MILLIMETRES
THESE NOTES ARE TO BE READ IN CONJUNCTION WITH THOSE ON SHEETS 23, 24, 27 AND 28
EXCEPT FOR THE LAUNCH AND JACKING BRACKET (A8) NONE OF THE TEMPORARY MATERIALS OR EQUIPMENT ARE PROVIDED IN THE MATERIALS LIST ON SHEET 28.

WINCHES FOR LAUNCHING

TWO WINCHES (5 TONNE CAPACITY) OR EQUIVALENT SHALL BE USED TO PULL THE DECK ONTO THE LIFT SPAN.
ATTACHMENT OF THE WINCHES TO THE DECK SHALL BE AS SPECIFIED ON SHEET 25.
THE PROPOSED METHOD AND EQUIPMENT DETAILS SHALL BE SUBMITTED FOR APPROVAL BEFORE THE BRIDGE IS CLOSED TO TRAFFIC.

ALLIGNMENT AND CLEARANCES DURING LAUNCH

ALL ROLLERS ON THE FLANKING SPAN SHALL BE PROPERLY ALIGNED TO ENSURE THAT THE DECK RUNS PARALLEL TO THE BRIDGE.
CLEARANCES AND ALIGNMENT SHALL BE CHECKED AFTER THE FIRST 3 m OF LAUNCH AND SUBSEQUENTLY AFTER THE LEADING EDGE OF THE DECK REACHES EACH CROSS BEAM.
IF NECESSARY THE ROLLERS MAY BE ROTATED SLIGHTLY TO ASSIST IN RE-ALIGNING THE DECK.
THE ALIGNMENT OF THE DECK SHALL BE CLOSELY CHECKED AT THE END OF THE LAUNCH.

POSITIONING ROLLERS AT CROSS BEAMS DURING LAUNCH

AT EACH CROSS BEAM THE LEADING EDGE OF THE DECK SHALL PASS AT LEAST 50 mm BEYOND THE CENTRE LINE OF THE CROSS BEAM.
THE LEADING EDGE OF THE DECK SHALL THEN BE LIFTED SLIGHTLY TO ALLOW THE REPOSITIONING OF THE ROLLERS AS SHOWN ON THIS SHEET.
THE LAUNCH CAN THEN CONTINUE TO THE NEXT CROSS BEAM.

LOWERING DECK ONTO CROSS BEAMS

THE LOWERING OF THE DECK SHALL BE PERFORMED IN STAGES AS SHOWN IN THE DIAGRAMS OF THIS SHEET.
EACH STAGE SHALL BE PERFORMED SIMULTANEOUSLY AT EACH OF THE THREE JACKING LOCATIONS ON A CROSS BEAM.
THE DECK MAY BE LOWERED AT ALL CROSS BEAMS SIMULTANEOUSLY OR AT ONE CROSS BEAM AT A TIME. REGARDLESS OF THE METHOD CHOSEN THE DIFFERENTIAL DISPLACEMENT OR DEFORMATION OF THE DECK SHALL NOT EXCEED THE LIMITS SPECIFIED ON SHEET 24.

LATERAL MOVE OF DECK TO FINAL POSITION

THE LATERAL MOVE OF THE DECK TO ITS FINAL POSTION UNDER THE FOOTWAY SHALL BE PERFORMED AS DETAILED IN THE DIAGRAM ON THIS SHEET.
THE NEOPRENE BEARING STRIPS (N2) SHALL NOT BE INSTALLED UNTIL AFTER THE MOVE IS COMPLETED. THE INTERFACE BETWEEN THE DECK AND THE CROSS BEAM SHOULD BE LUBRICATED. A THIN STRIP OF OILED TIMBER OR PLYWOOD (CONTINUOUS UNDER THE DECK) IS RECOMMENDED.
STOPS SHOULD BE FIXED TO THE TOPS OF THE CROSS BEAMS UNDER THE FOOTWAY TO PREVENT THE DECK FROM MOVING PAST THE DESIRED LOCATION. LOOSE SPACERS SHOULD BE USED BETWEEN THE ENDS OF THE DECK AND THE FLANKING SPANS TO MAINTAIN THE DESIRED GAP AT THE DECK JOINTS.
THE TEMPORARY HOLES FOR THE M24 BOLTS SHALL BE PLUGGED AFTER USE WITH M24 X 250 BOLTS AS SHOWN ON SHEET 24.

NOTES ON MATERIALS

ALL BOLTS, THREADED ROD AND ASSOCIATED NUTS SHALL BE TO AS1111 FOR GRADE 4.6 OR AS1252 FOR GRADE 8.8 AS NOTED IN THE TABLE.
ALL BOLTS, COACH SCREWS AND ASSOCIATED NUTS AND WASHERS (EXCEPT AS NOTED BELOW) SHALL BE HOT DIP GALVANISED TO AS1214.
ITEMS B10, B12, B13, B15 AND B16 SHALL NOT BE PROTECTIVE TREATED.

ALL STEEL PLATES AND SECTIONS SHALL BE TO AS3678 AND AS3679 RESPECTIVELY FOR THE GRADES SPECIFIED ON THE (FABRICATION) SHEETS REFERENCED IN THE TABLE.
ALL STEEL PLATES AND SECTIONS (EXCEPT AS NOTED BELOW) SHALL BE HOT DIP GALVANISED TO AS1650. ALL EDGES TO BE PROTECTIVE TREATED SHALL BE ROUNDED TO A RADIUS OF 1.5 mm.
ALL STEEL PLATES AND SECTIONS FOR TEMPORARY USE SPECIFIED ON SHEETS 22 THROUGH TO 27 SHALL NOT BE PROTECTIVE TREATED.

PRESTRESSING STRAND SHALL BE 7 WIRE STRESS RELIEVED, HIGH TENSILE STEEL, SUPER GRADE, LOW RELAXATION TO AS1311 WITH ANCHORAGES TO AS1314. STRANDS SHALL BE GREASED AND SHEATHED BY THE MANUFACTURER AND THE MAXIMUM OUTSIDE DIAMETER OF THE SHEATH SHALL BE 19 mm.
THE PRESTRESSING PROTECTION SYSTEM SPECIFIED ON SHEET 3, USING ITEMS V3 THROUGH V6 HAS BEEN DEVELOPED BY VSL PRESTRESSING AUSTRALIA P/L IN CONJUNCTION WITH THE ROADS AND TRAFFIC AUTHORITY (NSW) AND THE CONSULTANT. THIS SYSTEM HAS BEEN DEVELOPED SPECIFICALLY FOR USE IN STRESS LAMINATED TIMBER DECKS AND IS AVAILABLE FROM VSL PRESTRESSING P/L. THE DETAILS OF ALTERNATE PRESTRESSING AND PROTECTION SYSTEMS SHALL BE SUBMITTED FOR APPROVAL PRIOR TO CONSTRUCTION.

SRE EPOXY SHALL BE SEMI RIGID EPOXY RESIN JOINT SEALER "SRE/R" MANUFACTURED BY CTI.
TIMBER DECK LAMINATES SHALL BE AS SPECIFIED ON SHEETS 5 THROUGH 9.
THE GREASE FOR INJECTION INTO THE VOIDS AROUND THE SHEATHED STRANDS, AS SPECIFIED ON SHEETS 3, SHALL BE CASTROL APXT OR EQUIVALENT.
THE WOLFIN FLASHING SHALL BE 2 mm THICK AND ATTACHED TO THE DECK USING AN APPROVED COMPATIBLE ADHESIVE.
NEOPRENE STRIP BEARINGS AND WASHERS N1 TO N3 AND N5 TO N7 SHALL BE IN ACCORDANCE WITH RTA QA SPECIFICATIONS B280 "UNREINFORCED ELASTOMERIC BEARING PADS AND STRIPS" AS PROVIDED IN THE CONTRACT DOCUMENTS.
NEOPRENE WASHERS N4 MAY BE CUT FROM STANDARD NEOPRENE STRIP OR SHEET WHICH IS DESIGNATED AS SUITABLE FOR PETROL AND OIL APPLICATIONS.

GENERAL NOTES

THESE NOTES SHALL BE READ IN CONJUNCTION WITH THOSE ON ALL SHEETS AS WELL AS THE FOLLOWING ROADS AND TRAFFIC AUTHORITY (NSW) SPECIFICATIONS WHICH ARE CONTAINED IN THE CONTRACT DOCUMENTS:

RTA FORM 2382 "TIMBER FOR BRIDGES, STRESS LAMINATED TIMBER DECKS, SUPPLY AND HANDLING" (JUNE 1995)
RTA SPECIAL FORM 2381 "CONSTRUCTION OF STRESS LAMINATED TIMBER BRIDGE DECKS" (MARCH 12, 1999)
RTA SPECIAL FORM 2115 "STRESSING OF STRESS LAMINATED TIMBER BRIDGE DECKS" (MARCH 12, 1999).

* MINIMUM THREAD LENGTH 50 mm
** MINIMUM THREAD LENGTH 75 mm

DECK ASSEMBLY AREA

THE STRESS LAMINATED TIMBER DECK SHALL BE ASSEMBLED AND STRESSED TOGETHER OFF THE ROADWAY ON THE NORTH SIDE OF THE BRIDGE. THE SITE SHALL BE DESIGNATED BY THE DEPARTMENT OF INFRASTRUCTURE, ENERGY AND RESOURCES.
THE ASSEMBLY BED SHALL BE DESIGNED TO SUPPORT 1.5 TIMES THE WEIGHT OF THE NEW TIMBER DECK (1.5 X 90 TONNES) IN ORDER TO ALLOW FOR THE NECESSARY MEN AND EQUIPMENT FOR ASSEMBLY AND STRESSING. THE ASSEMBLY BED SHALL HAVE SUPPORTS (CONTINUOUS ACROSS THE WIDTH OF THE DECK) WHICH ARE COINCIDENT WITH THE PERMANENT CROSS BEAM SUPPORTS AS WELL AS INTERMEDIATE SUPPORTS MIDWAY BETWEEN THESE. EACH OF THESE SUPPORTS SHOULD BE AT LEAST 10 m LONG TO ALLOW FOR THE ADDITIONAL WIDTH OF THE LOOSE ASSEMBLY OF LAMINATES BEFORE STRESSING. EACH SUPPORT SHALL HAVE A SMOOTH TIMBER BEARING STRIP OR A SMOOTH STEEL BEARING WITH A WIDTH OF AT LEAST 100 mm.

CONSTRUCTION OF TIMBER DECK

EXCEPT AS NOTED IN THE DRAWINGS AND THESE NOTES THE CONSTRUCTION OF THE DECK SHALL BE IN ACCORDANCE WITH RTA SPECIAL FORM 2381 (MARCH 12, 1999).
1. THE DECK SHALL BE ASSEMBLED IN DECK SETS AS SPECIFIED FOR THE SELECTED OPTION FROM SHEETS 5 TO 8.
2. ALL LAMINATES SHALL BE NAILED AS OUTLINED IN RTA SPECIAL FORM 2381 AND CARE SHALL BE TAKEN TO ENSURE THAT EACH LAMINATE REMAINS VERTICAL AND PROPERLY ALIGNED.
3. IT IS RECOMMENDED THE TOP SURFACE OF THE DECK BE MARKED FOR THE LOCATIONS OF THE FOLLOWING ITEMS AND NAILING BE OMITTED TO FACILITATE DRILLING FOR THOSE ITEMS:
- TIE DOWNS AT CROSS BEAMS (SHEET 10)
- KERB BOLTS (SHEET 17)
- DECK JOINTS BOLTS (SHEET 12)
- FOOTWAY SUPPORT BOLTS (SHEET 20)
- DECK DRAINS (SHEETS 18 AND 20)

4. THE ASSEMBLY OF THE DECK SHALL COMMENCE FROM THE RAILWAY SIDE AND THE STRANDS SHALL NOT BE INSTALLED UNTIL THE DECK IS FULLY ASSEMBLED.
5. THE GREASE INJECTION HOLES AS SPECIFIED IN RTA SPECIAL FORM 2115 SHALL BE DRILLED IN EVERY 32ND LAMINATE RUN (1120 SPACING) ALONG EACH STRAND AS WELL AS IN THE OUTSIDE LAMINATE AS SHOWN ON SHEETS 5 TO 8.
6. THE PRESTRESSING STRANDS, PROTECTION SYSTEM AND ANCHORAGES SYSTEM SHALL BE INSTALLED AS SHOWN ON SHEET 3.
7. STRESSING OF THE DECK SHALL BE IN ACCORDANCE WITH RTA SPECIAL FORM 2115 AND THE STRESSING NOTES ON THIS SHEET.
8. GREASING OF THE VOIDS USING THE HOLES SPECIFIED IN 5 ABOVE SHALL BE PERFORMED IMMEDIATELY AFTER THE STRESSING OF THE DECK IS COMPLETED AND THE HOLES SHALL BE PLUGGED IMMEDIATELY AS SPECIFIED ON SHEETS 5 TO 8 TO PREVENT MOISTURE FROM ENTERING THE DECK.
9. SITE MEASUREMENTS SHALL BE TAKEN TO CONFIRM THE LOCATION OF THE RAILWAY SIDE KERB AND FOOTWAY SUPPORT BEARING.
10. REBATING FOR THE RAILWAY SIDE KERB SHALL BE PERFORMED AS SPECIFIED ON SHEET 17, BUT NO HOLES SHALL DRILLED.
11. THE FOOTWAY SIDE NEOPRENE BEARINGS (N5 TO N7) SHALL BE FITTED AS SPECIFIED ON SHEET 20. THE HOLES FOR THE RODS (B9) SHALL BE DRILLED USING THE BEARING PLATES AS TEMPLATES.
12. NO ADDITIONAL DRILLING OR REBATING SHALL BE PERFORMED UNTIL THE DECK HAS BEEN LAUNCHED INTO PLACE.

STRESSING OF DECK

1. EXCEPT AS OUTLINED BELOW STRESSING SHALL BE PERFORMED IN ACCORDANCE WITH RTA SPECIAL FORM 2115.
2. STRESSING SHALL ONLY BE PERFORMED UNDER THE DIRECTION OF THE DESIGN ENGINEER OR HIS DELEGATE.
3. A MAXIMUM NUMBER OF STRANDS SHALL BE STRESSED SIMULTANEOUSLY SUCH THAT THE FULL LENGTH OF THE DECK IS STRESSED DURING THE INITIAL STAGES.
4. UNLESS APPROVED OTHERWISE AT LEAST 10 JACKS SHALL BE USED AND THEY SHALL BE EVENLY DISTRIBUTED ALONG THE FULL LENGTH OF THE DECK.
5. THE GEOMETRY OF THE DECK SHALL BE CHECKED AS SPECIFIED IN RTA SPECIAL FORM 2115 OR ADDITIONALLY AS DIRECTED BY THE SITE ENGINEER.
6. THE OVERALL WIDTH SHALL BE CHECKED FOR CONFORMANCE WITH THE REQUIREMENTS ON SHEET 3 AFTER THE INITIAL STRESSING HAS BEEN COMPLETED. THE MEASUREMENT SHOULD ALLOW FOR ANOTHER 50 mm OF DECK COMPRESSION TO COMPLETE THE RE-STRESSING REQUIREMENTS SPECIFIED IN RTA SPECIAL FORM 2115.

STRESSING NOTES

THE FOLLOWING SHALL BE OBSERVED FOR THE 15.2 mm PRESTRESSING STRANDS (FORCE PER STRAND):

1. MINIMUM ULTIMATE STRENGTH = 250 KN
2. MAXIMUM PERMISSIBLE (DESIGN) JACKING FORCE = 210 KN
3. DESIGN FORCE AFTER TRANSFER = 175 KN
4. MINIMUM STRAND FORCE = 100 KN

THE MINIMUM STRAND FORCE IS APPLICABLE FOR FUTURE LONG TERM MAINTENANCE. THE DECK SHALL BE RE-STRESSED WHEN THE RESIDUAL TENDON FORCES FALL TO THIS LEVEL.

PREPARATION AND INSTALLATION OF THE DECK

THE PROCEDURE FOR REMOVAL OF THE OLD DECKING, INSTALLATION OF SPACER BEAMS AND CROSS BEAM STRENGTHENING SHALL BE DESIGNED TO MINIMISE THE OVERALL ROAD CLOSURE PERIOD.
THE CONTRACTOR SHALL SUBMIT THE DETAILS OF THE PROPOSED METHOD AND EQUIPMENT, INCLUDING PROPOSED ROAD CLOSURE REQUIREMENTS, WITH THE TENDER SUBMISSION.
THE ROAD CLOSURE PERIOD AND QUALITY ASSURANCE PROCEDURE FOR WELDING OF THE CROSS BEAMS SHALL FORM PART OF THE TENDER ASSESSMENT PROCESS. NOTWITHSTANDING THESE PROCEDURES A MAXIMUM 48 HOUR CLOSURE TO TRAIN TRAFFIC SHALL APPLY. THE NEW DECK WILL CONFLICT WITH THE RAILWAY CLEARANCES DURING TRANSPORT, LAUNCH AND INSTALLATION. THE INSTALLATION, INCLUDING THE LATERAL MOVE UNDER THE FOOTWAY, IS TO BE COMPLETED WITHIN THE 48 HOUR WINDOW SPECIFIED ABOVE.

ADDITIONAL NOTES ON CROSS BEAM WELDING

PRIORITY SHALL BE GIVEN TO INSTALLING AND BOLTING THE SPACER BEAMS AND LAUNCHING BRACKETS AS SPECIFIED ON SHEET 15 TO FACILITATE LAUNCHING OF THE DECK. WELDING OF THE CROSS BEAMS AND BOTTOM FLANGE STRENGTHENING MAY BE PERFORMED DURING LAUNCHING AND INSTALLATION WITH THE FOLLOWING EXCEPTIONS.
1. NO SPACER BEAM OR BOTTOM FLANGE PLATE SHALL BE PARTIALLY WELDED WHEN THE DECK IS CANTILEVERED OVER THAT CROSS BEAM.
2. NO SPACER BEAM OR BOTTOM FLANGE PLATE SHALL BE PARTIALLY WELDED DURING THE PASSAGE OF TRAINS.
3. ALL WELDING SHALL BE COMPLETED BEFORE THE BRIDGE IS RE-OPENED TO ROAD TRAFFIC.

SECTION A

GENERAL NOTES

STRUCTURAL STEEL.

1. ALL STRENGTHENING STEEL TO BE GRADE 250LO.
2. ALL TEMPORARY WORKS STEEL TO BE GRADE 250.

WELDING.

1. ALL WELDING TO BE S.P. CATEGORY IN ACCORDANCE WITH AS1554, PART 1.
2. ALL ELECTRODES FOR FILLET WELDS TO BE E48XX.
3. ALL FULL PENETRATION BUTT WELDS TO DEVELOP THE FULL STRENGTH OF 250LO STEEL.
4. ALL FILLET WELDS TO BE 6mm. U.N.O.

DIMENSIONS.

1. ALL KEY DIMENSIONS TO BE CHECKED ON SITE PRIOR TO STEEL FABRICATION COMMENCING.

NOTES :

1. FOR GENERAL NOTES REFER TO DRG. Nº 1503 / 14.
2. MINIMUM JACK CAPACITY TO BE 400 KN.
3. JACKS SHALL BE LOCATED BETWEEN THE PACKING POINT AND THE CLOSEST TRANSVERSE WEB STIFFENER OF THE EXISTING ℄ GIRDER.
4. MAXIMUM ECCENTRICITY OF THE JACKS FROM THE ℄ OF THE PACKING POINT SHALL BE 200 mm.
5. ALL JACKS AND PACKS ARE TO BE POSITIONED CENTRALLY BELOW ℄ GIRDER WEB.
6. JACKS TO BE SYNCHRONISED TO ENSURE EQUAL LOADING DURING JACKING OPERATIONS BY HYDRAULIC LINKING OR OTHER APPROVED METHOD.
7. LOAD PER JACK PRIOR TO PACKING TO BE AS FOLLOWS — INNER ℄ GIRDERS (Nº's 2 & 3) 100 KN.
   OUTER ℄ GIRDER (Nº 1) 85 KN.
8. MINIMUM BEARING AREA OF JACKS AND PACKERS ON BOTTOM FLANGE OF ℄ GIRDERS TO BE 150mm x 150mm
9. METHOD OF PACKING AT GIRDER PACKING LOCATIONS AND LOCATION OF JACKING POINTS SHALL BE TO THE APPROVAL OF THE SUPERINTENDENT.

GENERAL NOTES:

STRUCTURAL STEEL
1. ALL STRENGTHENING STEEL TO BE GRADE 250L0
2. ALL TEMPORARY WORKS STEEL TO BE GRADE 250

WELDING
1. ALL WELDING TO BE S.P. CATEGORY IN ACCORDANCE WITH AS1554, PART 1
2. ALL ELECTRODES FOR FILLET WELDS TO BE E48XX
3. ALL FULL PENETRATION BUTT WELDS TO DEVELOP THE FULL STRENGTH OF 250L0 STEEL
4. ALL FILLET WELDS TO BE 6mm U.N.O.

DIMENSIONS
1. ALL KEY DIMENSIONS TO BE CHECKED ON SITE PRIOR TO STEEL FABRICATION COMMENCING
